THAT is the Fork

you should fit to your present mount or specify on your New Model if you would be absolutely assured of comfortable riding over every kind of road or track——the

DRUID MARK II.

(Vertical & Horizontal Action).

Don't leave the important question of Forks to chance, but specify the DRUID MARK II.—the ONLY Fork which totally absorbs WITHIN ITSELF every kind of shock to which the machine is liable.

Fuller details with pleasure

A. DREW & Co., Ld.
LeopoldSt., B'HAM.

The DRUID MARK II. for Solo or Sidecar Machines. Made in three models.

1913 Triumph, 3½h.p., 3 speeds (Sturmey), and sidecar, complete with accessories; £37.—Colmore Depot, 31, Colmore Row, Birmingham. [5920

1913 3½h.p. 3-speed Triumph, with Canoelet coachbuilt sidecar; £50, cash or easy terms.—R. E. Jones (Garages), Ltd., Swansea, London, Cardiff. [0734

1913 3½h.p. Triumph, 2-speed, free engine, complete with sidecar and accessories; £33.—Colmore Depot, 31, Colmore Row, Birmingham [5921

1914 3-speed Triumph, Lucas front and rear lamps, condition guaranteed as new; £47.—W. Brandish, Triumph Garage, Foleshill Rd., Coventry. [X3299

LATE 1914 4h.p. Triumph and Millford family sidecar, 3 lamps, horn, speedometer, spares, perfect condition; £60.—Phillips, Sunbury, St. Cross, Farnham. [5639

1915 Triumph and Sidecar, 3-speed, speedometer, lamps, etc., all as new; £55, lowest; owner enlisted.—Apply, White, 21, Burghill Rd., Sydenham [X3013

TRIUMPH, 1914, 3-speed, and new coach sidecar; £55; deferred payments arranged.—Lamb's, 151, High St., Walthamstow, and 50, High Rd., Wood Green. [5657

1913 3-speed Triumph, with brand new 17 gn. Gloria sidecar, luggage rail, all accessories, perfect; £50, cash or easy terms.—R. E. Jones (Garages), Ltd., Swansea, London, Cardiff [0720

TRIUMPH, 1911, 3½h.p., single speed, complete lighting set, new Avon back tyre, excellent condition, just overhauled, £19.—H.B., Nurses Cottage, Sutton Rd., near Maidstone. [X3249

1913 Triumph, free engine, speedometer, 2 gas lamps, Mabon gear and clutch, all new tyres, only done 3,000 miles; £37/10.—W. J. Machrell, The Druid's Head, Broadway, Deptford [5779

TRIUMPH, 1910, cylinder, pistons, connecting rod, bushes, valves, tappets new this month, T.T. bars, all accessories, tyres perfect; £25, or nearest.—Law, Officer's Club, Penkridge Camp, Staffs [X2780

4h.p. 1914 Triumph, 3-speed and free engine, touring model, fitted with Gloria sidecar, including all accessories; price £48, guaranteed; opportunity to secure a reliable bargain.—Wauchope's, 9, Shoe Lane, London [X3190

TRIUMPH, 3½h.p., magnificent condition, extra fast, climb anything, only wants seeing, £22; another ditto, with 2 speeds, and Montgomery sidecar, perfect, £30; car wanted.—Brooks, Church St., Caversham, Reading. [5609

1914 Triumph, 4h.p., 3-speed, large P. and H. head light, rear lamp, horn, knee grips; overhauled at a cost of £14, in magnificent condition throughout, only 44 gns.—Julian, Broad St., Reading. Biggest dealer in the South 'Phone: 1024 [X0801

TRIUMPH and Gloria sidecar, both new this year, 4h.p., 3-speed hub, Lucas best accessories, trip speedometer, Pillion seat, back-rest, spare tyres, valves, tubes, etc.; cost £90, sacrifice £55, nearest; appointment.—Booth, Paddington Infirmary, W. [X3063

TRIUMPH, 1913, 3-speed, magnificent £17 1915 Gloria coachbuilt sidecar, absolutely as new and unscratched, luggage grid, tyres in splendid condition, speedometer, head and tail lamps, horn, etc., whole outfit in magnificent condition and one of the smartest and most luxurious on the road; cost over £83, accept for quick sale 45 gns.—Julian, Broad St., Reading. 'Phone: 1024. [X3143

Tyler.

TYLER 2-strokes, 2½h.p. 3-speed; £33/1/6.—In stock at Alexander's, 115, Lothian Rd., Edinburgh. [5156

2½h.p. Tyler, 2-stroke, 2-speed, 1915 model, complete, with all accessories; £27/10.—Wauchope's, 9, Shoe Lane, London. [X3182

Velocette.

VELOCETTE 2-stroke, model D, 2-speed, the economical 2-stroke; £36/10; chain drive.—Immediate delivery at Alexander's, 115, Lothian Rd., Edinburgh. [5154

SPECIAL NOTICE.—*Copies of "The Motor Cycle" can only be sent to neutral European countries if posted direct from the office of the publishers, or by newsagents who have obtained permission from the War Office for this purpose. The publishers of "The Motor Cycle" have obtained the necessary permission, and, consequently, can send subscribers' copies as usual. Before sending through newsagents it is important to enquire if permission has been obtained, as otherwise copies intended for neutral European countries will not be forwarded by the Post Office.*

Rattle in Two-stroke Engines.

WHY does a two-stroke engine rattle is a question very much akin to the old query "Why does an engine konk?" There are many answers to each of these questions, but none hitherto has been entirely convincing. It is, therefore, more than likely that the cause is not the same in every engine. In fact, there is but little unanimity amongst users regarding either the cause or the cure. A sound theory is that the rattle is caused by piston tap, due not to the change of angularity of the connecting rod, but to the piston being blown across the cylinder by the rush of incoming gases against the baffle plate on the piston head. But if this be the cause, new engines should rattle as well as old, and the rattle does not as a rule occur during the first few hundred miles, and a cure would be effected by admitting the inlet gas on both sides, though in this case the scavenging would probably be very faulty. It would be interesting to hear whether those engines which are designed to admit the charge through a valve at the cylinder head ever rattle.

It is also suggested that carbon on the piston head is the cause. This collects all round the edge, forms a hard ring, and touches the cylinder head at the top of the stroke. Filing the edge of the piston is sometimes found to be a cure in this case. A dirty engine can produce rattle as well as knocking either when combined with overloading or not. Here again we find great differences of opinion, for some riders assert that overloading alone is a frequent cause of rattle, while others assert that rattle ceases when the engine has work to do.

Again, it has been urged that rattle in a two-stroke is equivalent to konking in a four-stroke engine; others deny this, for they assert that they can make their engines konk as well as rattle. Other possible causes are stuck piston rings and faulty crankshafts or connecting rods, and the rings catching the lip of the ports; this last is naturally more likely to occur when the ports are wide.

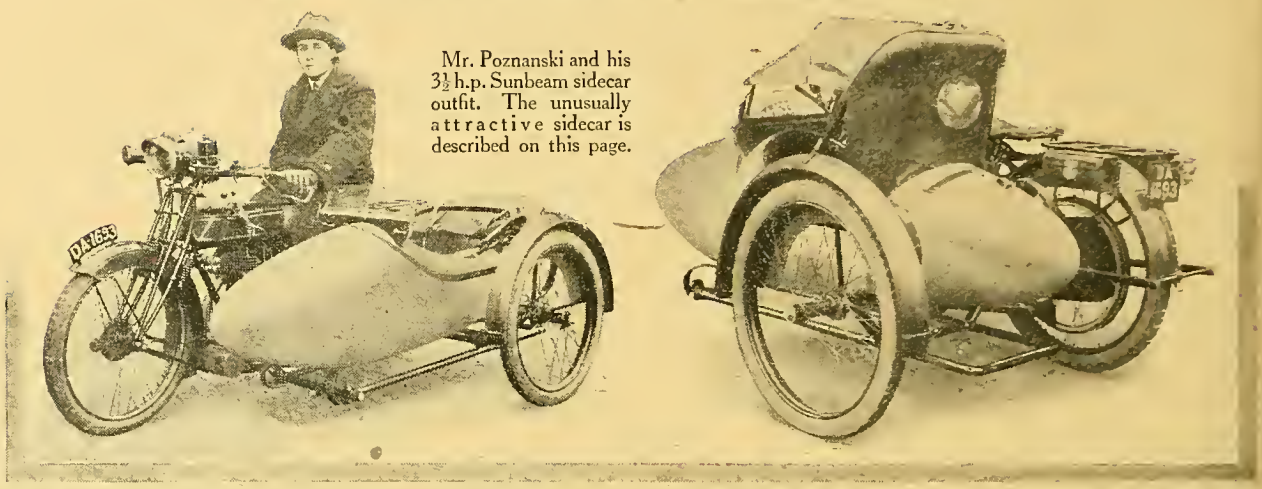
It is possible that an offset gudgeon pin or a gudgeon pin set higher up in the piston might mitigate, if not cure, the trouble. We are, however, of opinion that, if an engine is kept clean, especially the ports and piston head, the rattle will be much less likely to make itself felt.

Crank Cases.

IN view of the rapidly increasing uses for aluminium in connection with motor vehicles and aeroplanes for warlike purposes, it is quite conceivable that ere long there may be a shortage of this material. Consequently, it behoves manufacturers of motor cars and motor cycles to look ahead for an efficient substitute. The reason aluminium has been used for the crank cases of motor cycles is, of course, wholly and solely its lightness. In some respects aluminium is an entirely unsuitable material. We refer to its porous nature, which renders it difficult to arrange a firm security for the cylinder holding-down bolts. Now, there is no reason whatever why we should use a cast iron cylinder mounted on an aluminium crank case split vertically. There would be certain advantages, such as the elimination of another joint and rendering the internal parts more readily accessible, in casting the cylinder in one piece with the top half of the crank case, the lower half to be a stamped steel casing, or, for that matter, a cast iron base could be used A disadvantage of cast iron, however, is its susceptibility to damage in the event of the crank case fouling any obstruction, but, after all, an impact on the crank case of an engine, sufficient to break metal, is a most unusual occurrence.

An index to the advertisements in this issue will be found on the page facing the back cover.

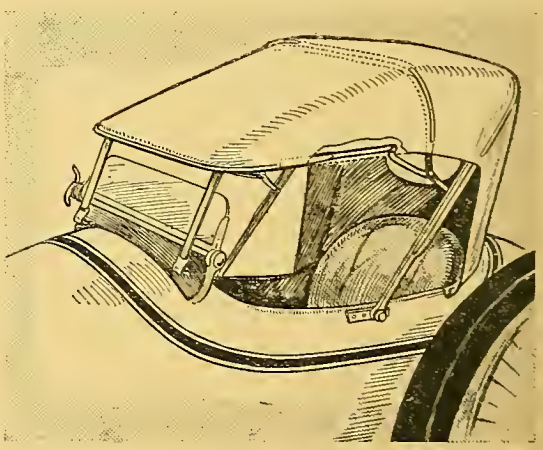
A STREAMLINE SIDECAR.



Mr. Poznanski and his 3½ h.p. Sunbeam sidecar outfit. The unusually attractive sidecar is described on this page.

WE recently had the opportunity of seeing an exceedingly neatly designed sidecar body which has been invented by Mr. Poznanski, a Russian gentleman who has lately been in Russia in charge of 400 Sunbeam motor cycles which have been supplied to the Russian Army. The body was made by Messrs. Haywood, of Wolverhampton, and is of an exceedingly attractive appearance, forming a practically perfect ovoid. It is constructed of metal, shaped on a wooden frame, the metal, which, by the way, is of no constructional importance as it forms merely a mould, is absolutely smooth, and, moreover, beautifully finished. It has a neat half screen in front, and a well upholstered back, while behind there is a spacious locker capable of containing spares and other useful articles.

The hood is worthy of attention, being of very smart design, and one of the illustrations shows how compactly it may be stowed away when not in use. The joints of the body are all brazed and are invisible. The sidecar axle tube passes through the hollowed out portion of the body, and is not noticeable unless actually looked for. The Millford chassis has been very slightly altered to render it suitable for the special body.



Hood and screen fitted to Poznanski's sidecar.

Motor Cycling on the Australian Goldfields.

(BY A CORRESPONDENT IN WESTERN AUSTRALIA.)

HOME readers will probably be interested in the doings of fellow-motorists on the goldfields of Western Australia. Motoring here on roads that are universally rough and bumpy is perhaps not so pleasurable as on the beautiful roads of England, but still it is fast becoming popular, and is now being followed keenly by many riders in the Kalgoorlie and Boulder City districts. British machines are the most popular, B.S.A. being first in favour, followed by Douglas, Triumph, Rudge, and others, with a few Indians. At present we have only one cycle car, though several are being built privately.

Some time ago the Goldfields Motor Club was formed, and it has successfully run several sports meetings and road races. The club's proudest possession is its unique natural racing track, Lake Perkolille, which is situated about twenty-two miles from Kalgoorlie. It is remarkable for the fact that during the dry season its hard clay surface is perfectly flat, and the heaviest motor cars and motor cycles can race on it all day without at all cutting up its surface. The lake is about two miles long by one and a quarter miles wide, and a splendid circular track of two and a half miles can easily be pegged off which is perfectly safe, and can carry any pace which the machines are capable of. A straight mile can be run down the centre, with plenty of room for starting and stopping.

The lake is surrounded by low rolling hills with plenty of natural shade, the only drawback—a very slight one—being that water has to be carted from a place called Kanowna, ten miles away.

Owing to the exceptionally wet season the club has been unable to use the lake since last Christmas.

COUNTERSHAFT.

Dimming Electric Lights.

I notice many of the car men are dimming electric lamps by slipping a small tulip-shaped cap of black material over the bulb, its sides being slashed like a mediæval swashbuckler's jacket. One at least of the firms catering for motor cyclists has adopted a more excellent way. It may not be public knowledge that Messrs. Lucas now market a duplex bulb for use with their head lamps; there are two filaments, one faint and the other bright, operated by a switch embodied in the lamp socket. This method is economical of current, and leaves half or full illumination instantly at the rider's service.

The Absolute Limit.

One of my soldier visitors home on leave says the absolute limit is to be sent with a despatch through Ypres on a wet night with steel-studded covers. No lamps are allowed—that should go without saying. Ypres is shelled intermittently at all hours of the day and night, and the never-too-excellent paving is freely scarred with shell holes. Supposing the unfortunate D.R. manages to dodge shells and old craters alike, and can see his way sufficiently distinctly to dodge ruined houses in the inky gloom, his reserve intelligence and courage can be devoted to keeping the machine upright on a surface so vile that a traction engine might be pardoned for capsizing on it at 2 m.p.h. The M.M.G.S. men say their job isn't a tea party, but that it is slacking compared with the lot of certain D.R.'s who are well up near the Front.

Three-wheeler Design.

Mr. A. A. Scott's latest notion in the way of a modern three-wheeler suggests a contrast alike with the *fin de siècle* sidecar and various obsolete inventions on other lines. Among them I specially remember the Avon Trimobile, which some readers will recall as consisting, broadly speaking, of the front half of a De Dion tricycle and the rear half of any old two-seated small car. It had its faults, as all motor vehicles of the same date had theirs; but can anybody tell me why the designers of three-wheelers will do anything and everything rather than put their single front wheel in the centre of the chassis? [Many designers prefer two tracks to three.—ED.] If you put it out to one side, as the common practice is, you spoil the balance of your vehicle and you weaken the frame; not improbably, you further complicate the steering. There is not the least reason in the world why a vehicle should not be evolved on these lines, which would look better and last better than any lop-sided three-wheeler, besides being easier to manipulate, weighing no more, and costing no more. But we began our three-wheel passenger development with a lop-sided idea, and it looks as if we were too conservative to abandon it or even to give a more healthy-looking plan a decent trial. We should at least hear no more of broken frames if we discarded the lop-sided ideal; and there are large areas in this particular market where detachability, the basic principle of the original sidecar boom, has long ceased to be either desirable or possible.

An 8 Cwt. Sidecar Outfit.

Little did I think in the early days, when we all saw a crude wicker chair flimsily attached to a 2 h.p. Minerva and marvelled greatly, that I should ever live to ride in a sidecar outfit *de luxe* scaling 8 cwt. Yet this is the exact weight of a combination in which I was riding the other day, a dynamo set accounting for the best part of the last cwt. The outfit had just recorded its 3,500th mile, and was still running excellently, though it had never been decarbonised; engines carbon up comparatively slowly if worked on a small throttle opening, with just the wee trickle of oil required for gentle speeds. The back tyre, a Palmer cord 700 × 80 mm. light car type, had no ribbing left on it, but would have been good for a considerable mileage if the owner had not left it standing in a pool of oil during a month of disuse; at least that is how I should diagnose a single patch of the tread, which was worn right down to the casing, the remainder of the periphery being in first-rate order.

Brake Control on Spring Frames.

The one *caveat* we shall have to enter when the rear-sprung frame at last comes into its own has reference to brake control. Our main brakes have always been mounted on the back wheel, and though our transmissions are becoming more reliable, we must still refrain from fixing the service drum on the gear box after car practice. If the rear portion of the frame is constantly varying its position, we shall be unable to use the rigid rods employed at present for actuating the rear brake. I know such rods work well on cars, but they are usually 6ft. or so in length, so the angularity is small, and the rods have a certain degree of elasticity. A couple of feet is nearer the distance between pedal and brake crank on a motor bicycle, and the angularity therefore forbids rigid control rods. It looks as if Bowden wire would have a fresh innings. There will be some prejudice against it amongst the old brigade at the outset, for we suffered many things with the push bicycle rim brakes hastily fitted to the original motor cycles of 1900 or so; but I see no reason why the famous firm should not rise to the emergency. Its wire can stand strains a hundred times heavier than motor cycle braking occasions; when the boom comes I hope the Bowden people will be well ahead with substantial long range adjusters, heavy cables, and well-butted sheathing. It will be needed! Perhaps we may see final shaft transmission, and the main brake on the countershaft.

HINTS AND TIPS FOR WINTER RIDING.

Some Methods of Protecting both Rider and Machine.

By H. MORTIMER BATTEN.

THE season of rain and puddle is at hand, and since many riders—some from choice, some from necessity—use their machines throughout the winter months, an article on the above subject is, I suppose, seasonable.

In the first place we have to accept the fact that 90% of the machines on the road are hopelessly inefficient as regards mudguarding and personal protection. Thus it is that the rider who wishes to remain on the road during the winter months must make special preparation for the season—both as regards his own personal comfort and the welfare of the machine.

Prevention Better than Cure.

Every practical rider knows the hopelessness of cleaning his mount during the winter months. Personally, I abandoned the habit something like ten years ago, and instead I make a rule of starting the winter with the machine thoroughly waterproof, so far as it is possible to make it. If this is done properly no material damage can result by neglect of the cleaning process, and the ultimate spring cleaning should reveal a machine little the worse for the lusty bucketing it has undergone. Certainly it is in better condition than if no special preparations had been made, for any amount of time spent in cleaning cannot overcome the mischief done by the exposure of those parts, which really should be protected, to the road and the weather.

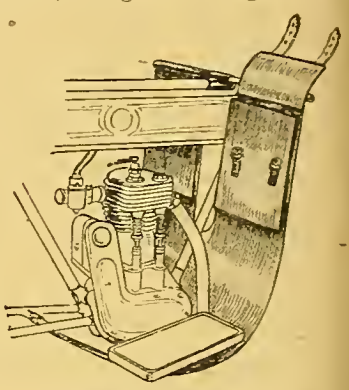
Front view of latest model Scott, showing good shield design.

I am inclined to think, too, that constant cleaning is a mistake, for it is almost impossible to clean a machine thoroughly without working grit into the cycle bearings.

Guard against Winter Atmosphere.

Again, it must be remembered that deterioration goes on not only when the machine is on the road, for it is the damp atmosphere of winter that takes off the lustre even more than mud and rain. Copious polishing between the intervals of use in no way protects the machine from the detrimental effects of the atmosphere. On the contrary, each polishing takes life out of the plated parts, so obviously it is a better plan to protect these parts from the atmosphere, and then leave them severely alone.

Many riders experience trouble with their wheel hubs from the effects of winter riding, and this is really not to be wondered at when one realises the usual system of lubricating these parts. Ordinary hub or engine oil is generally used, and probably the hub is caked with mud during each periodical oiling. Under such conditions it is almost impossible to prevent grit, either from the hub or from the spokes, falling into the oil cups, and thus finding its way to the cones. Further, the oil, being thin, hangs about the joints of the wheel bearings, and the action of the wheel causes it to "squelch" in and out, carrying finely ground grit with it.



The College mud-shield for fitting to existing machines.

The cycle bearings suffer most by winter riding, and the problem of protecting them is perfectly simple. First purchase a tin of thick grease (the stiffer the better) and a grease injector with screw-down plunger. Remove the oil cups from the wheels and make neat little wooden plugs to screw in their place. Pack the hubs cram-jam full of grease and replace the plugs.

This system of lubrication is far more permanent than the oilcan system, and the grease, being thick, acts as a packing, and prevents grit working in at the cones. It does not squelch in and out of the bearings, but forms in a solid lump round the loose joints.

The steering head and other parts can, of course, be similarly treated, and when properly packed require no further attention for at least 1,000 miles.

Every rider takes a sneaking interest in his plated parts, even though he upbraids their existence, and a very simple and handy way of waterproofing these parts, also those enamelled parts which are particu-

The P. and M. leg shield is in one piece, provision being made for the cooling of the cylinder.

Hints and Tips for Winter Riding.—

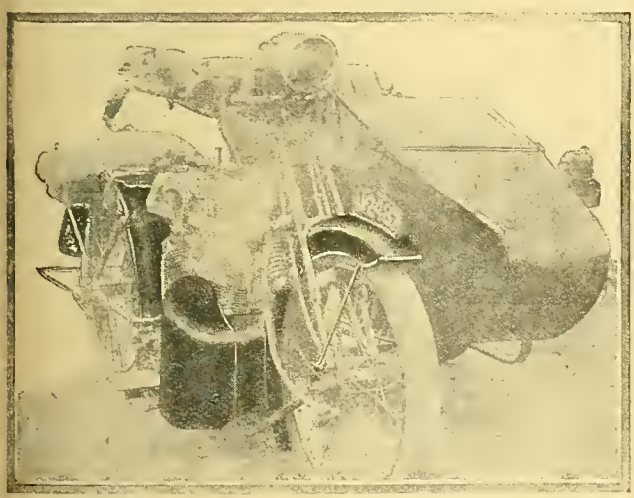
larly exposed to road contributions, is to paint them liberally with a coating of beeswax dissolved in petrol. Keep a tin of the solution handy, and daub it on every time the machine is cleaned. A soft bristled brush should be used, and the mixture made to the consistency of cream.

The preparation does not add to the appearance of things, but it is quite the most practical method I have come across. As regards handle-bars, the best plan is to wrap them from beginning to end in insulation tape.

Guarding against Chill.

Having accomplished these seemingly commonplace duties the next thing to aim at is to protect one's lower members from mud and wet. Of course, this is easily done by piling on snow shoes, overalls, and waders, but this kind of protection is of a very superficial order, and it is far better to get down to the very root of things. If the mudguarding is at all as it should be there is no need to don special suits of armour for winter riding, and the thing to aim at is to prevent the slush from reaching one's person, particularly one's feet. So long as one's feet are exposed to damp and cold, chill is sure to follow, and on a long ride this chill gradually creeps upwards through one's limbs in spite of thick and heavy clothing. If, on the other hand, a rider can succeed in keeping his feet and legs dry and warm, the trouble is largely overcome.

The Kumfurt Accessories Co. have tackled the mudguarding question very ably and thoughtfully, and most of their fitments are genuinely efficient in making



A.J.S. leg shield, which protects engine and magneto in addition to the rider's feet.

up what is usually lacking for one's personal comfort. The fitments that particularly take my fancy are the Hammock footboards—in that they fill the bill on the point of chief importance, that of keeping one's feet and legs dry and secure from draught. They also afford a degree of protection for the magneto (if placed low down), engine, and transmission, and, finally, they are designed to save the machine in case of a fall.

I have many times previously pointed out the comfort of leg shields, and personally I would not contemplate the winter months with a machine unequipped in this direction. At the same time I am compelled

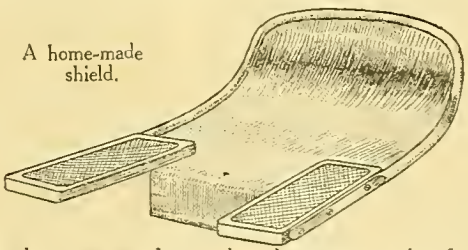
The Kumfurt hammock leg shields and footboards, designed to protect the rider and insulate him from road shock.

to own that the fitments necessary for winter riding often defeat their own ends when it comes to the dry roads of the summer months. It is then that their presence creates something like a vacuum behind the rider, with the result that the dust whips in and makes an intimate acquaintance with those parts of one's person the shields are primarily intended to protect.

I suppose this is why makers do not fit leg shields as standard. The average rider is a fair weather rider, and he would regard their presence as an unnecessary and troublesome encumbrance. It would appear to be difficult to design a shielding system which meets the demands of winter and summer also, and it seems to me that, for a long time to come, we shall have to be content with the "quick detachable" variety, and really they leave little to be desired if riders will but sample them.

A Home-made Leg Shield.

An adequate leg shield, which can be adapted to most machines, is very easy to make for those who prefer the home-made variety. All that is required is a length of ⅜in. round iron, flattened and drilled at the ends to be screwed to the footboards. A glance at the accompanying sketch explains matters. The



A home-made shield.

iron is bent upwards so that it protects the feet and ankles of the rider, while being insufficiently high to prevent the necessary cooling current from reaching the engine. A piece of American cloth is then sewn to this supporting frame, thus entirely enclosing the intervening space. It is a good plan to allow a weighted strip of the fabric to hang down to within

Hints and Tips for Winter Riding.—

an inch or two of the road, as this prevents mud thrown up by the front wheel finding its way to the transmission and the machine generally.

Some years ago I rode with a contrivance of this sort attached to my ancient P. and M., and it served admirably throughout the winter. Many times I rode without overalls in a dress suit on that machine, an idiot in an opera hat clinging to the carrier, and, strange to say, the topmost portion of the opera hat was the only portion of our attire to collect road splash!

The Comfort of a Third Wheel.

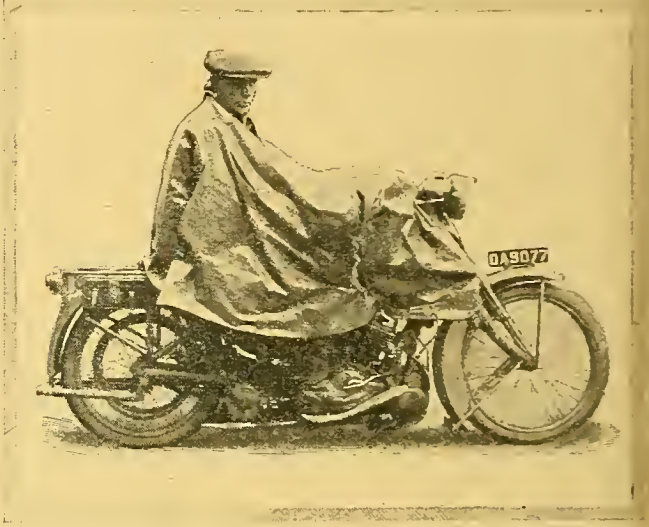
Last autumn I advocated in this journal the use of light and inexpensive sidecars as stabilisers for solo machines during the winter months, and though such an attachment takes the polish off one's road speed in windy weather or on hilly roads, the convenience of the third wheel far outweighs any such trivial drawbacks. A dry pair of gloves, a duster, and sundry odds and ends in the way of personal equipment can be kept clean and dry under the sidecar apron, and this ample carrying room is very convenient in addition to the extra degree of stability in city traffic.

My present business outfit, a 3½ h.p. Sunbeam fitted with the maker's leg shields, and with "Empire" featherweight sidecar attached, reaches my ideal as a winter mount. The Sunbeam people have given some attention to the mudguarding question, and on this machine, in spite of its very considerable speed, it is possible to ride over the worst of roads and emerge unspotted. I have added a fourth attachment to the sidecar connections, and this addition I have found necessary with every featherweight I have ridden. The "Empire," however, in spite of its extreme lightness, is quite a rigid little affair, and the Sunbeam clutch is worth at least another 1 h.p., and on account of its weatherproofness.

The Question of Personal Attire.

We now come to the vitally important point of personal attire. One could, of course, write volumes on this subject, but I am attempting to consider the demands of the everyday rider of humble means who has no intention of attempting elaborate experiments.

During the last few winters I have experimented with many varieties of patent motor clothing, and though the majority have their distinct merits, I employ the simplest of clothing for business use. A seaman's tarpaulin, with leather belt amidship, costs but a few shillings, and is good for keeping out the wind and the weather for at least 4,000 miles. Rub it over with a clean oily cloth now and then, supplement the bottom button with a well sewn strap, and you have one of the strongest and most serviceable motor cycling mackintoshes it is possible to buy.



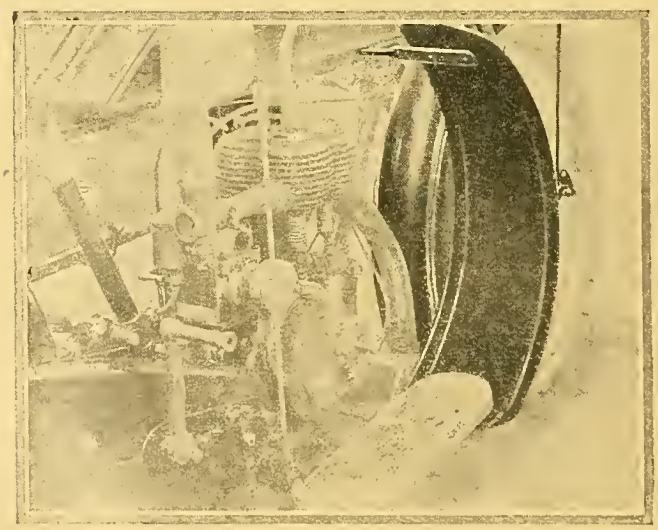
A serviceable cover-all cape made by Mr. J. Rogan, of Rippingham Road, Mottington, Manchester. It answers the double purpose of keeping both rider and machine dry and clean.

The loose, tarpaulin leggings, resembling very baggy trouser legs, made to match, make an excellent combination with the mackintosh, but two pairs should be bought, as they become ragged in half the time.

Something is, of course, required under this, as the wind and the weather work in through the joints on a long ride, and a short poncho, reaching down to the knees and made with only a short joint at the neck, answers admirably. A good woollen muffler is by far the best thing for preventing the water from running down the neck as it is absorbent and makes what fitters call a close fitting joint. A leather apron, such as blacksmiths use, is an excellent thing to wear round one's waist, and personally I would not be without one of these on a long winter ride.

A trouble which is most difficult to overcome is brought about by water collecting on the top of the tank and blowing back on to the rider's legs. Knee grips largely do away with this trouble by diverting the stream, but so long as the water is able to collect it is bound to drip somewhere.

It was this state of affairs which first drew my attention to the cover-all mackintosh made by Mr. J. Rogan, of Withington, and during the last few weeks I have put one of these capes to a thorough test. It has the distinctive merit of keeping the rain not only off the rider but also off the machine, and thus it gets to the root of half the trouble.

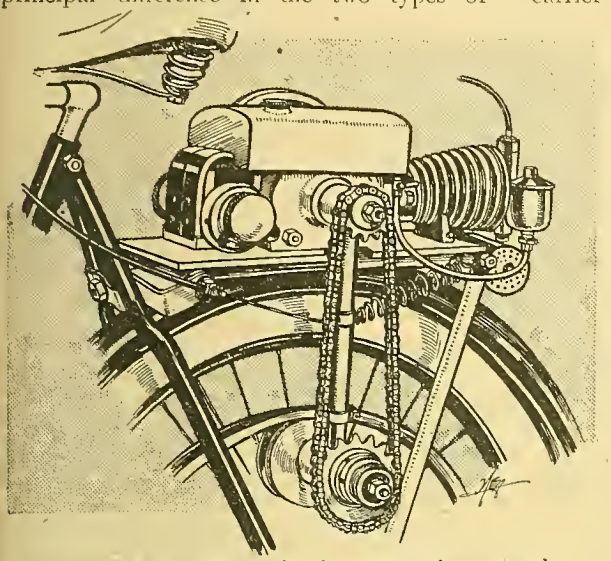


Back view of Sunbeam leg shield.

THE "CARRIER MOTOR."

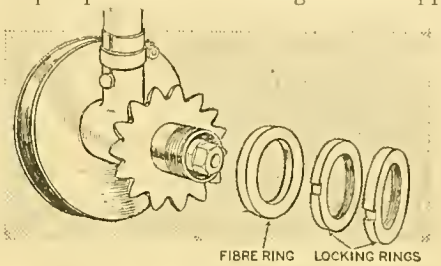
How Inventors are Turning Attention to the Motor-assisted Bicycle.

THE motor attachment for pedal cycles is at present receiving attention at the hands of designers, and, as distinct from the Auto-wheel type, latest designs consist of a small power plant carried on a platform above the rear mudguard. The principal difference in the two types of "carrier motor" described hereunder is that one is friction-driven and the other belt-driven. There should be a fair demand for an attachment of this type, provided that it is efficient and reliable. Both designs are certainly neat and compact. We describe first the attachment, which is at present in its experimental stage, and is being placed on the market by the London and Westminster Industrial Syndicate, 8, Victoria Street, S.W.



London and Westminster pedal cycle motor attachment complete.

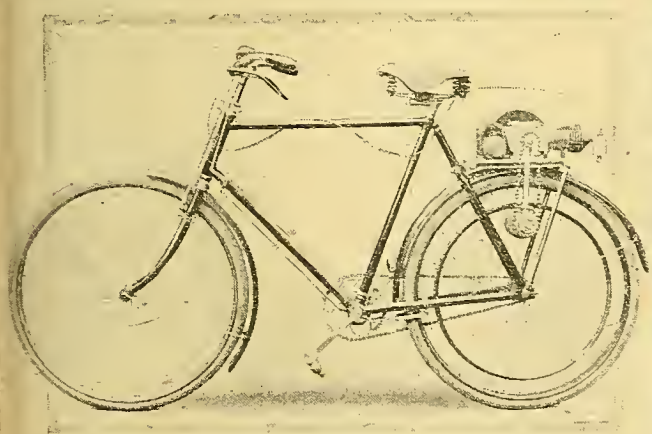
The sketch clearly shows the form the present model will assume when absolutely complete. It will be seen that the power plant is carried on an aluminium platform held by brackets and stays which are adaptable to any form of pedal cycle. The engine in this first model is a four-stroke, the dimensions of which are 52.5 mm. × 54 mm., 117 c.c., which is carried horizontally on the platform. The tank is carried saddle fashion over the crank case, and at the present time an external timing gear is fitted. The transmission is by chain to a sprocket on a rocking arm, this arm having a phosphor-bronze bearing at its uppermost end, moving on a steel sleeve fixed over the boss of the crank case. The lower end of the arm carries a spindle, on one end of which is fitted the driven sprocket, and on the other a fibre pulley wheel engaging with the underside of a belt rim spoked on to the wheel of the bicycle.



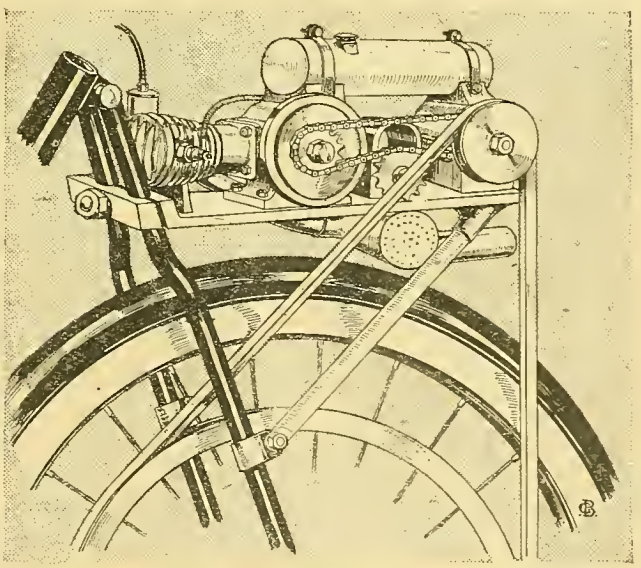
Details of the transmission shock absorber on the London and Westminster Industrial Syndicate's motor attachment.

The next sketch shows the form of transmission shock absorber employed, the sprocket being loose on the spindle, secured merely by friction, there being one fibre ring and two locking rings.

Now, when the engine has started there is a tendency for the fibre pulley to run towards the rear of the machine along the belt rim, and this has the effect of increasing the grip in proportion to the amount of pull. The spring shown in the illustration has not for its object the pulling up of the pulley against the



The pedal cycle motor attachment marketed by the London and Westminster Industrial Syndicate, in position on a pedal cycle. It is complete except for the petrol tank.



Another type of "carrier motor" attachment patented by H. H. Patrick and the Oxygen Welding Works, Ltd.

The "Carrier Motor."—

belt rim, but is merely a "take off" spring, so that when the lever on the handle-bar is applied the arm is pulled into the central position and free engine is obtained.

The future model will be provided with a two-stroke engine, lubricated on the petroil system, and supplied with gas from a floatless carburetter. The weight will be in all about 16 lb. Stays in two different sizes will be provided, so that the attachment can be fixed on cycles with 26in. or 28in. wheels. The attachment is certainly neat, and the method of transmission ingenious, and we shall be interested to see how it behaves when actually used upon the road.

Another Design on Similar Lines.

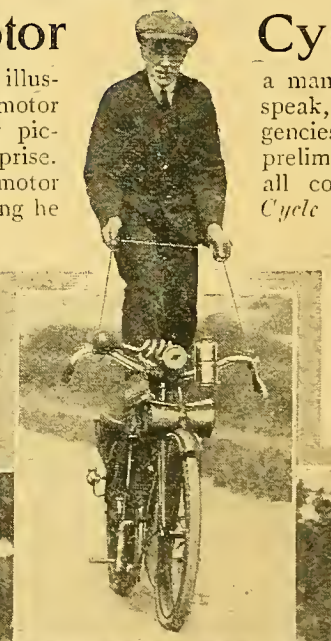
Curiously enough, an attachment somewhat similar to that described has just been brought to light by the publication of patent specification No. 3,514, 1915, in the names of H. H. Patrick and the Oxygen Welding Works, Ltd., of New Summer Street, Birmingham. In this construction also the power plant is located on a platform mounted over the rear wheel, but the cylinder head faces forwards, and power from the engine is conveyed by a chain to a gear box. From this the drive passes to the rear wheel by means of a V belt. The chain which transmits the power to the gear box is arranged also to effect rotation of the magneto driving sprocket. The tank is mounted on supports as shown, and the silencer is attached to the underside of the platform.

Colonel H. C. L. Holden, C.B., F.R.S., who on many occasions has acted as judge at various A.C.U. trials, has recently been elected one of the Wardens of the City Guild of Gunmakers, a company still exercising to the full the powers granted to it by charter, under which it was constituted the Proof authority for London. Colonel Holden is an old artillery officer, and he brought out, some thirteen years ago, what was the first four-cylinder motor bicycle, and although he has seen forty years' service he is still doing valuable work for his country.

Juggling with a Motor Cycle and Sidecar.

WE have on more than one occasion illustrated trick riding "stunts" on motor cycles, so that the accompanying pictures will not come altogether as a surprise. They show G. A. Roberts, a young Leeds motor cyclist, who appears to be able to do anything he likes with his mount, which, by the way, is not a modern one.

Whether motor cyclists do things of this sort merely for amusement or as a preliminary training to despatch riding, we are not in a position definitely to say. No doubt they assist in making a man part and parcel of his machine, so to speak, and so able to act quickly in emergencies, though if trick riding were a necessary preliminary to fit one for a motor cycle under all conditions, the circulation of *The Motor Cycle* would not be what it is. At any rate, the pictures go to prove that rational riding cannot be so difficult anyway. We should not advise readers to attempt to emulate the tricks illustrated unless it is done on a borrowed machine and on a deserted stretch of road.



A DARING MOTOR CYCLIST AND SIDECARIST.

(Top) Standing on the saddle and steering with string.

(Left) Standing on the sidecar chassis with wheel off ground.

(Right) Steering with the feet.

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, London, E.C., and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy, for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

Quality of Petrol.

You would greatly oblige if you would kindly give a hint as to the working value of petrol No. 1 and No. 2 compared with the price.—2¾ H.P.

For ordinary running you would probably not notice any difference between the two spirits, except that it is possible that you would obtain a greater mileage per gallon on No. 2, while starting from cold in winter would possibly be slightly more difficult. No. 1 would give greater speed, owing to its more rapid evaporation.

Smoke from the Pulley Release.

I should be obliged if you would kindly answer the following questions: (1.) My engine has lately started to issue smoke and oil from the hole in the pulley-shaft. Should it do this, and what is the cause, as it never used to do it before I had my engine taken down? (2.) Would it be harmful to close the hole?—G.D.T.

(1.) We do not think there is any harm in a little smoke issuing from the hole in the pulley-shaft. It might mean that you have been over-oiling, or there is a slight leakage past the rings; but if the engine is not giving trouble, or if there is no falling off in power, we do not think you need worry. (2.) If you close the hole, oil will be forced out through the bearings, and you will suffer from an oily crank case.

Misfiring.

I have a 2¾ h.p. Douglas, but in getting up speed it misfires a lot. It seems much better after I have attained a speed of about 20 m.p.h. I have tried retarding the spark, but it does not make any difference. The engine has had a complete overhaul just recently. I should be glad if you would tell me the remedy.—A.G.N.

Your trouble is possibly due to incorrect mixture. You should make sure there are no air leaks in the induction pipe unions, and see that the unions are screwed up tightly. The latter can also be bound up with insulating tape. You should also make sure the plugs are not faulty, and that the points are clean, and are adjusted between ½ and 1 mm. apart. The contact breaker should also be looked to, and you should see that the bell crank is not sticking, and that the points do not separate more than ½ mm. Retarding the ignition would certainly make matters worse. You might also make sure the valve springs are strong enough.

Size of Belt Rim.

(1.) What sized belt rim (1in. belt) would be necessary on the back wheel of an 8 h.p. machine which is to have a maximum gear of 3½ to 1, with a Philipson governor pulley? From what points is the diameter of a belt rim measured? (2.) I have a pair of handle-bars which are very wide, and although not very low (the grips are level with the top tube) give a low position. I have found them perfect for grease and traffic, but find that I get a slight "speedman's wobble" on even fairly good roads at 50 m.p.h. or so. They are like the Rover T.T. bars, but much wider, so if I took off two or three inches at each end, would I be steadier? If not, what shape and width would you recommend? I think the rake of the head and its distance from the saddle are both normal.—N.V.G.

(1.) With a standard Philipson pulley of 5½in. diameter you would require a belt rim of 18in. to give you the gear you mention. It would probably be more satisfactory to obtain a rather larger pulley, if possible, rather than fit a very small belt rim. For the purpose of measuring the gear it is usual to take the point in the pulley where the centre of the belt is when bedded down. In giving the measurement of a pulley or belt rim it is usual to quote the measurement from edge to edge. (2.) Excessively wide bars are certainly inclined to exaggerate a wobble at speed, though it is hardly likely that the bars are the cause of it. It is more likely that the wobble is caused through loose joints in the spring forks or a tight or excessively loose steering head. The best bars for preventing wobbling at speed are those that are perfectly comfortable for the individual rider; this can only be found by experiment. It is not wise to have the grips too wide apart. Any good cycle or motor repair man should be able to make you up a pair of bars to the shape which you think would be most comfortable for you, or you would probably be able to obtain some various patterns already made up from some of the accessory stores.

THURSDAY NEXT.
THE MOTOR CYCLE
Buyers' Guide Number.

Fitting a Magneto.

I have an old 2 h.p. Minerva-engined motor cycle. The engine is fitted in an inclined position, and is attached to the down tube of the frame. I have asked several cycle dealers about fitting a magneto to it, but they all say it would be better to buy a second-hand modern machine. I would like your opinion on the matter. (1.) Will the above machine run as well with a magneto? (2.) Could the magneto be driven from the shaft the contact breaker was on? (3.) How many teeth would be required for the sprocket on the shaft, and how many for the sprocket on the magneto?—J.S.

It would, of course, be better to have a modern machine. (1.) The machine would go better with a magneto. (2.) Yes, the magneto could be driven from this shaft. (3.) It does not matter much how many teeth, as long as you have the same number on each sprocket. The usual number is twelve. The shaft is already running at half engine speed.

Starting from Rest.

I have just purchased a two-stroke two-speed countershaft motor cycle, and up to the present I find it very difficult to start. I might say that I am a cripple, and do not like to run and jump on from footboards, being afraid I should overbalance. I have ridden a pedal cycle for years, and always mounted from rear step. Is it possible for me to have any other means of starting? The makers advertise a slipping clutch. Could this be fitted to answer my requirements? Could I place the change speed lever in neutral and paddle off?—J.W.S.

By all means have a clutch, two-speed gear, and kick starter, then you will be able to start away without any difficulty. If the makers of your machine advertise a clutch, we presume they can fit it, and we should recommend you to get into communication with them. If you put the change speed lever into the low gear, and raise the compression release, you will possibly be able to start off by paddling with your feet on the ground. It is no good putting the change speed lever into neutral, as you cannot start by this means on the run.

The Magneto Switch.

I have a 2½ h.p. lightweight motor cycle fitted with a U.H. magneto which has a screw on the side for a connection—I expect a cut-out. Will you please say if this is so, and if it is advisable to couple it up, and how to do this? On the engine there is no drain tap, so how can I drain the dirty oil out, and why is this omitted? —H.W.

The terminal in question is for a cut-out switch. To connect this up get an ordinary magneto switch, fix this to the handle-bar, and lead low tension wire from the terminal on the magneto to the terminal on the switch. In place of the drain tap there is probably a plug through which oil in the crank case may be drained. If not, we should advise you to have a plug or tap fitted.

Rattle in a Two-stroke.

My 2¼ h.p. two-stroke has developed a rattle, especially when descending hills, also immediately I open the throttle further at twenty miles an hour. I believe this is a sign of wear in the big end. Am I right? If so, how can I remedy it? I intend taking the engine down for the first time. Please inform me the best way to remake joints with brown paper.—J.W.H.

The causes of two-stroke rattle are not yet agreed upon. The rattle may be due to excessive carbonisation, and, if so, the cylinder should be removed, and the carbon deposit cleaned from the cylinder head, piston, and the ports. If the big end is worn, the only cure is to have this rebushed. If you are careful in dismounting the cylinder, there is no reason why you should disturb the joints, which are made of brown paper soaked in boiled linseed oil. If, however, you are unfortunate enough to break one of these, it is quite easy to make another, using the old joint as a pattern, or, if it is too far gone for this purpose, you may get a piece of brown paper about the size of the top of the crank case, smear oil on each of the holding down bolts, then press the paper on. This will give you the position of the holes, which can then be cut. Next smear the top of the crank case where the washer is to go liberally with oil, slip the paper over it, well over the part you have oiled, tapping the edges gently with a hammer. By this means you will get a perfect washer. Other washers in your machine are likely to be of the copper and asbestos variety.

READERS' REPLIES.

Misfiring.

I notice in the issue of *The Motor Cycle* for October 28th, page 433, a question from "J.H.M." I had exactly the same trouble with my machine, a 1914 5-6 h.p. Rudge-Multi, also fitted with Ruthardt magneto. In my case the trouble was traced to the sticking of the rocker arm in the contact breaker on which the fibre wheel is fitted. I first thought it was the fibre wheel which was, and is still, very loose, but now my machine fires perfectly at all speeds.—F. W. Algar.

If "J.H.M." bends the spring of his contact breaker, so that a stronger contact is made by the platinum points, I think his trouble will vanish. One pattern of C.A.V. magneto is so designed that the centrifugal force opens the points at speed, so that they do not meet till the speed lowers.—A.H.J.

"J.H.M.'s" case, given in *The Motor Cycle* of October 28th, reminds me of a similar case I heard of a short time ago. His trouble seems to be in the silencer chamber, and I would strongly advise him to remove the silencer and go into some out-of-the-way part and test the behaviour of the engine. I rather fancy the slowing down will disappear as it did in a case I heard of, thus giving him the clue as to where the trouble lies. I had a short spell of a similar trouble on my own motor cycle. Since I drove a flattened piece of steel into each of the opened ends of the silencer the trouble, which was due to sooting up, has entirely gone.—J. Scanes.

A Simple Test of Lubricating Oil.

I see in your issue of October 28th that a correspondent asks how he may test the quality of lubricating oil. There is one way which should be easy to any amateur. A poor lubricating oil always causes a big carbon deposit. Let your correspondent take a little of the oil he wishes to test, place it in an open tin, and heat over a flame, letting the oil boil for some time. If the oil is poor, there will be a burnt residue left on the tin, and similarly, of course, a large carbon deposit if this oil be used in the cylinder, the top of the piston corresponding to the tin. The better the oil, the less the burnt residue, and the less the carbon deposit. A good oil should give no residue at all, and hardly any deposit. I trust this tip may be of some use.—Eric R. Troward.

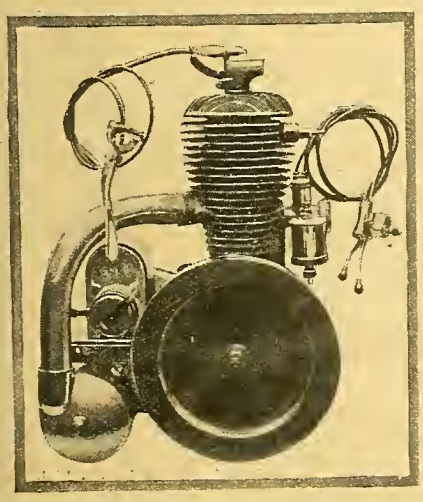
NEW MODELS

· MANUFACTURERS' PROGRAMMES FOR 1916 ·

A NEW HORIZONTAL HUMBER.

FOR once in a way the old-established name of Humber, Ltd., will not appear in our Annual Buyers' Guide. The position is a curious one. Prior to the outbreak of war the firm was busily engaged on its 3½ h.p. single-cylinder air-cooled and 6 h.p. horizontal water-cooled twin machines, but the whole of the stocks of these two models have now been exhausted, and the firm's energies are concentrated upon the very necessary munitions of war. Immediately after peace is declared, the company proposes to produce an entirely new model, which we have seen on the road on several occasions under test, and we are able to outline its specification. The machine in question will have a 4 h.p. horizontal twin-cylinder air-cooled engine, and in general appearance will follow the lines of the 6 h.p. water-cooled twin, a large number of which are now on the road and giving satisfaction to their owners. The cylinder dimensions of the new "after the war" model are 68 mm. bore × 68 mm. stroke (494 c.c.). The 4 h.p. mount will have a three-speed gear box and clutch, the design of which will be practically a replica of the 6 h.p. model, while the ever-popular chain and belt transmission is used. This new Humber is intended as a double-purpose mount, and will prove quite a departure for the firm, which, by the way, has now had several years' experience in the manufacture of horizontal engines. Had it not been for the war, the 4 h.p. horizontal air-cooled Humber would have been very much to the front at this period, as so satisfactory had it proved under test that it was proposed to embark upon its manufacture in large quantities. As it is, the 4 h.p. horizontal twin must remain an entirely new type, to be eagerly awaited after the war.



Power unit of the 1916 two-stroke Metro.

NEW MODELS ALREADY DESCRIBED.

Many 1916 models have been described in "The Motor Cycle" during the past few weeks, and for convenience of reference we give below an alphabetical list showing the dates on which these descriptions have appeared:

Ariel 3-speed gear	Sept. 30, p. 316
Auto-wheel	Oct. 28, p. 418
Bamford variable gear	Sept. 2, p. 227
Borgo (Italian)	Nov. 11, p. 461
Bradbury	Oct. 21, p. 402
Brough horizontal twin	Sept. 9, p. 264
" "	Oct. 28, p. 419
Calthorpe 2-str. & 4 h.p. twin	Oct. 7, p. 349
Campion 2 and 4-strokes	Nov. 4, p. 442
Connaught	Oct. 14, p. 369
Douglas 4 h.p.	Oct. 7, p. 348
Dunkley lightweight and sc.	Oct. 14, p. 369
Edmund spring frame	Oct. 14, p. 366
Excelsior (American) 7 h.p.	Oct. 7, p. 346
Indian 2-stroke lightweight	Oct. 14, p. 371
Indian 7 h.p. twin	Oct. 21, p. 394
Ivy 2 and 4-strokes	Oct. 14, p. 368
Jardine gears	Nov. 4, p. 444
J.E.S. 1 h.p. lightweight	Oct. 21, p. 393
Levis	Oct. 21, p. 395
New Imperial	Oct. 14, p. 372
New Ryder 2 and 4-strokes	Oct. 21, p. 393
" " "	Nov. 11, p. 465

P. and M.	Oct. 14, p. 370
Premier	Nov. 11, p. 468
Revere 2-stroke	Oct. 21, p. 393
Scott	Nov. 11, p. 466
Service 2¾h.p. 2-stroke and sc.	Sept. 2, p. 228
Sturmey-Archer l'weight gear	Oct. 28, p. 421
Vindec 6 h.p. and sidecar	Oct. 28, p. 421
Wooler 2-stroke	Nov. 4, p. 445
Wulfruna	Oct. 14, p. 373
Yale 7 h.p. twin	Oct. 7, p. 357
Zenith	Oct. 21, p. 402

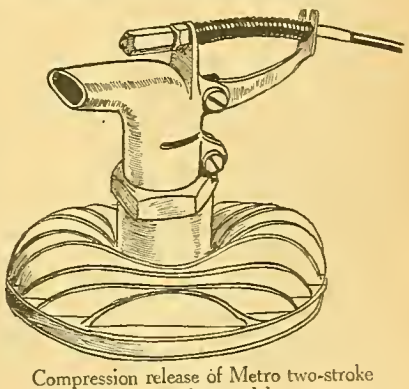
THE METRO TWO-STROKE
Open Frame and Sporting Models.

FOR 1916 the Metro Manufacturing and Engineering Co. are concentrating their energies on the 2½ h.p. two-stroke sporting model, which will not be altered radically from the 1915 design, and also an open frame model, which we illustrate.

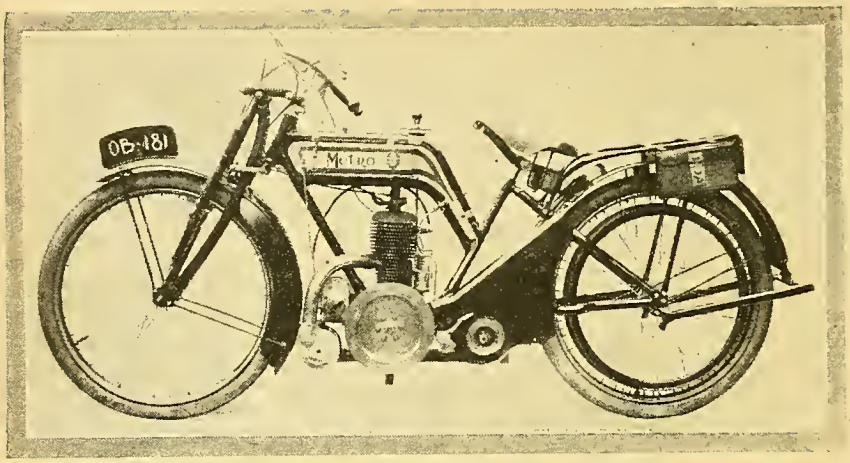
The engine has a bore and stroke of 70 mm. × 70 mm., giving a capacity of 269 c.c. Very large air cooling ribs are used, with further transverse ribs across the top of the cylinder, curving downwards in the centre to receive the pressure release valve and its separate small pipe. The fins taper towards the base, and give the cylinder the modern pear-shaped appearance first familiar with the Gnome aviation engine. Every care is taken, both in manufacture and erection, to prevent the escape of oil from any of the joints, a trouble rather frequently encountered even with modern two-stroke engines. The flywheel is external and of large diameter, with the weight massed at the outer edge. The crank pin is solid with the webs, and the big end of the connecting rod is, therefore, split to take the two gunmetal halves of the bearings. Hence, it is easy to remove the connecting rod and piston when it becomes necessary to adjust the bearings, and there is no necessity for fresh bushes when the ones originally placed in the engine may have become worn.

Two rings only are used for the piston, the gudgeon pin being secured in phosphor bronze bushes by a small set screw firmly locked in position when it has once been screwed home.

There is an external transfer passage cast as part of the cylinder and delivering mixture from the crank case to the combustion space when the piston falls below a port cut in the cylinder wall, there being the usual sharp-edged baffle plate on the top of the cast iron piston to direct the incoming mixture towards the head. A Senspray carburetter is bolted to a port behind the transfer passage, and feeds the crank case through a cast passage, divided from the transfer passage by a wall. The carburetter is at the rear of the cylinder, while the exhaust pipe, which is of large diameter, is taken in an easy curve from the front of the cylinder to a large circular silencer secured below the magneto platform. Oil is led from the tank through a large Best and Lloyd sight feed lubricator and adjustable drip feed to a pipe connected to the inlet passage from the carburetter, oil being sucked into the engine with the incoming gas, a method which tends to



Compression release of Metro two-stroke sporting model.



Specimen of the latest lady's model Metro, showing sloping handle-bars and dress-guard design.

keep the carburetter cleaner, and, in some measure, to prevent oil being blown from the air intake of the carburetter all over the machine and its rider.

An Attractive Petrol Tank.

In the sporting model the top tube of the frame is inclined from steering head to seat pillar, and the tank is therefore of wedge shape. In order to increase the capacity of the latter, however, it also widens gradually towards the forward end, being in shape somewhat like the Tourist Trophy tank fitted to the Douglas machines, and giving this sporting model a remarkably neat and workmanlike appearance. Brampton biflex front forks are fitted.

There is a heel-operated rear brake on the left-hand side of the machine, the pedal being on the footrest tube, while the brake acts on the belt rim below the chain stays. The Bowden operated hand brake acts as usual on the front rim. We understand that the special compression release shown in the sketch is manufactured and fitted under licence from the Triumph Company, although it is of slightly different form from that on the Junior Triumph. Every effort has been made to stop oil diffusing from the end of this tube and spreading about the engine and machine.

Both the oil and petrol fillers are large enough to enable the rider to do without a petrol funnel should this be necessary; 26in. wheels are fitted.

THE SCOTT SOCIABLE.

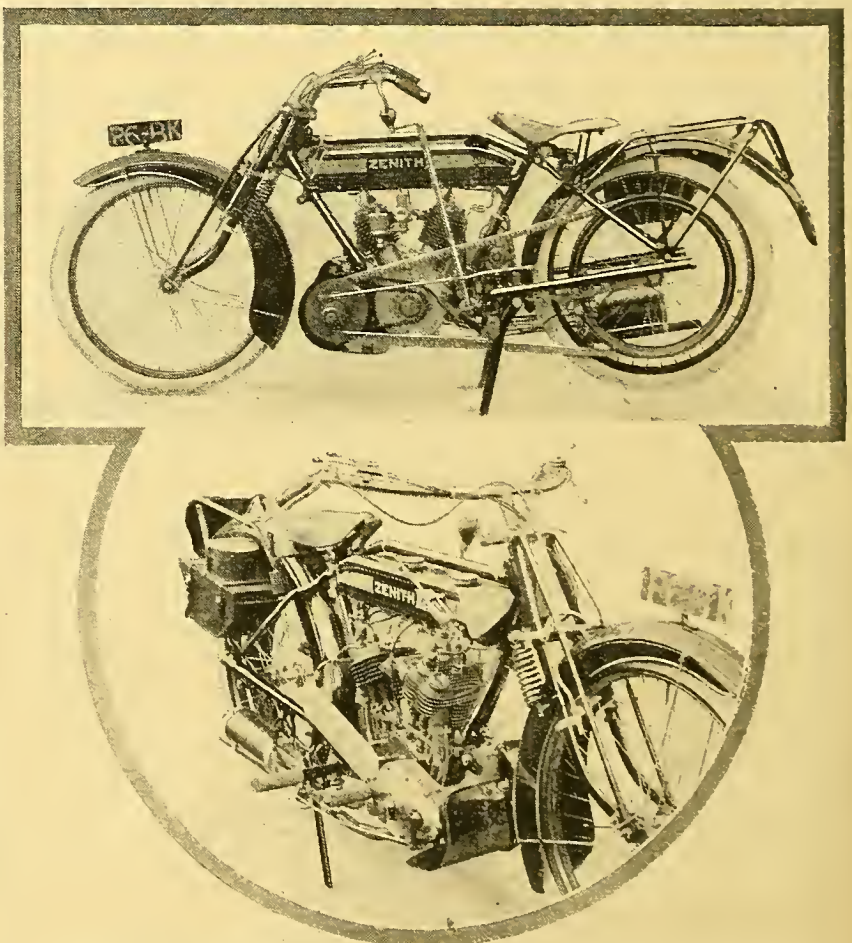
Possible Developments.

READERS may wonder why we do not describe and illustrate by photographs the Scott three wheeled sociable, a drawing and description of which appeared in our last issue, page 452. When we state that this entirely new design, the publication of details of which has created great interest in the motor cycle world, is under test by the military authorities, it will be seen that an illustrated description at the moment would be injudicious. Needless to say, our connection with the Motor Machine Gun Service renders Mr. Scott's latest creation of special interest to us. There are two examples on the road at present which have been before the military authorities, and these are being exhaustively tested under all conditions. It is remarkable that, though this vehicle has a shaft drive, a three-speed gear, and a two-stroke engine of approximately 4 h.p., measuring 3in. × 2½in. (570 c.c.), its weight, without extras, is not more than 5 cwt.

This double-seated sidecar is the result of Mr. Scott's labours for many months past—in fact, ever since he left the Scott Engineering Co.'s works to act as consulting engineer to the company. Mr. Alfred Scott has many admirers among the motor cycling fraternity, and a weatherproof touring vehicle on the lines of the machine we illustrated a fortnight ago will be eagerly awaited.

THE SINGLE-CYLINDER ALLON.

IT has been known for some time past that the Alldays and Onions Pneumatic Engineering Co., Ltd., were experimenting with an air-cooled twin-cylinder vertical-engined two-stroke. Some premature details of an engine of this type, purporting to be a new model Alldays, have already appeared in print, but the makers assure us that the model to be placed on the market eventually (not in 1916) will be very different from the experimental model, and a description of this engine would, therefore, be confusing. For 1916 the firm will



4-5 h.p. twin-cylinder Zenith in its latest form. The upper view shows the drive, which, of course, embodies the Gradua gear. The 1916 Zeniths were described in *The Motor Cycle* of October 21st, page 402.

New Models.—

devote its attention to the 2¾ h.p. Allon single-cylinder, which has a bore and stroke of 70×76 mm.=292 c.c. This little mount—one of the first incorporating the increasingly popular sloping top tube, with its coffin-shaped tank—has been wonderfully successful during the past year, and it is not surprising, therefore, that little or no alteration is being made to it for 1916. It may be obtained as a single-geared mount, or with a two-speed gear, clutch, and kick starter, or minus the two last-named fitments.

ROYAL RUBY IMPROVEMENTS.

THERE is no lack of enthusiasm and progress at the Royal Ruby works. Many improvements are under way, but the difficulty lies in carrying them into practice.

Royal Ruby Lightweight.

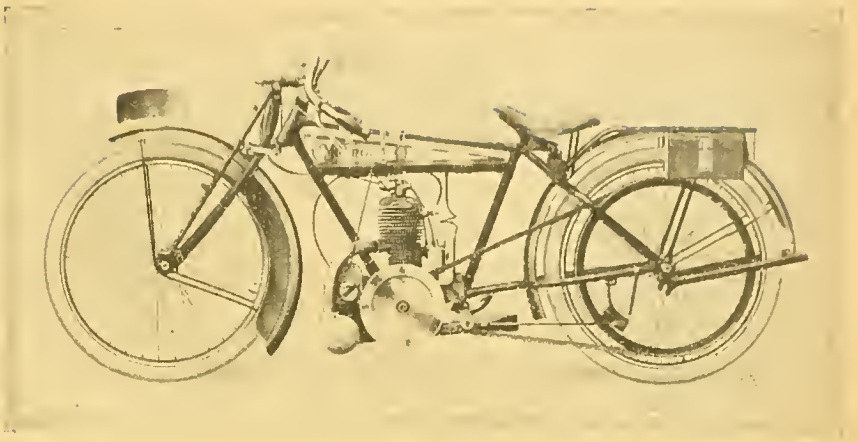
Dealing firstly with the Royal Ruby lightweight (269 c.c. Villiers engine), one or two minor alterations have been made which should add to the efficiency of this model. Side shields have been added to the mudguards, and a very much stronger and heavier carrier has been fitted. The tool bags fit snugly in at the sides of the carrier, and are strongly secured. Dunlop rubber-studded tyres are now fitted as standard, and a specially strengthened ball head has been adopted. The seat lug, supporting the two top bars, is strengthened and in one piece, but, excepting these alterations, the lightweight models for 1916 are unchanged.

Heavyweight Machines.

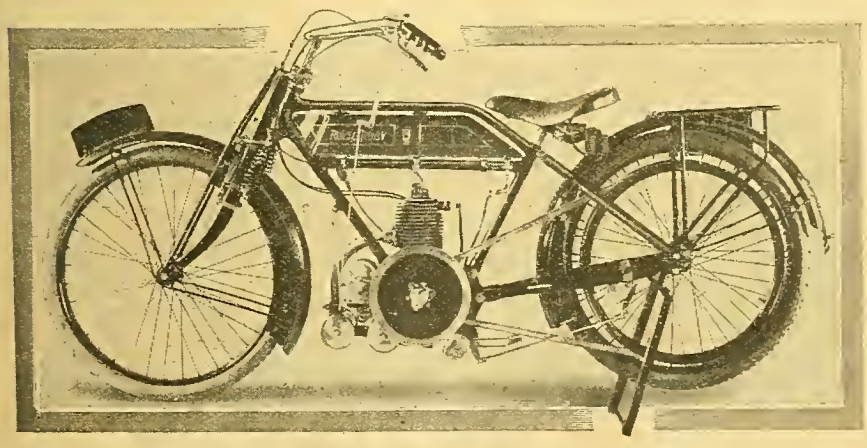
In the standard heavyweight models considerable alterations are to take place, though final arrangements are not yet completed. A Jardine four-speed gear is to be fitted, and very strong and businesslike rear forks have been designed for its adaptation. A hand lever on the tank is provided for controlling the clutch in addition to the foot lever, and its usefulness is beyond question. A special feature of the new model will be in the ingenious construction of the rear portion of the frame. The back stays, carrier, and mudguard can be removed as one unit by simply drawing two bolts. The rear mudguard has been very considerably widened, and the stand is automatic in action, rising and engaging with a strongly constructed clip when the machine is pushed forward. The rear wheel can be withdrawn in a few seconds by simply removing the spindle, the wheel falling clear when this is done.

Another excellent feature of the new model will be the ingenious provision made for adjusting the height and angle of the footboards. By simply loosening one nut the boards can be swung into a position to suit the rider, and securely locked there.

The makers are also experimenting with a new pattern fibre-to-metal internal expansion rear wheel brake, and though it must be clearly understood that some time will elapse ere these improvements can be carried into practice, it is pleasing to note that, in spite of the difficulties of manufacture, every effort is being made to improve the new models. Many minor points of convenience are to be incorporated, and the makers are paying special attention to the demands of their many Overseas riders.



The sporting model two-stroke Metro, described on page 493 of this issue.



The 1916 model two-stroke single-geared Royal Ruby lightweight.

Royal Ruby Rear Sprung Model.

Though far from completed, this model is well advanced in the experimental stage, and during our visit to the works we were privileged to examine and try a rear sprung machine. Probably the worst stretch of road in Manchester—a small back street paved with huge cobbles of considerable antiquity—was selected for these activities, the machine being fitted with an 8 h.p. J.A.P. engine and Jardine four-speed.

It may be mentioned that long leaf springs are used, and that all the working members concerned are of ample dimensions and very strong in construction. The wearing surfaces throughout are large, and it may further be mentioned that the unsprung weight is reduced to an absolute minimum.

The machine we tried during a Manchester drizzle over this abominable and greasy stretch of road was minus back stays, and it would seem that these usually important members are of value only in assisting to check any side roll, were the existence of such probable. Even without the stays we noticed no irregularity in the steering, though the road was unusually slippery, and the machine hardly of a type one usually rides solo.

The action of the springs was excellent. There was no rattle, and even when ridden at high speed over the pot-holes no suggestion of jar was conveyed to the rider, though the road was so bad that the front forks bumped continuously.

The Royal Ruby rear spring frame is unquestionably a mechanical proposition, and no effort is being spared by the makers to provide something really good in this line.

BAT MOTOR CYCLES IN 1916.

THE Bat motor cycle works have been almost entirely taken over by the Government, so the output of Bat motor cycles for 1916 is likely to be quite infinitesimal. There have been no alterations whatever since the particulars of the Bat 1915 models were published in *The Motor Cycle* eleven months ago.

THE 1916 J.H.

An M.A.G. Mechanical Oil Pump.

THE J. H. Motor Engineering Co., of Oldham, are making few alterations for 1916. The lightweight model remains unchanged, except that B. and L. drip feed lubrication is now preferred to the petroil system hitherto employed. Also side valances have been added to the rear mudguard.

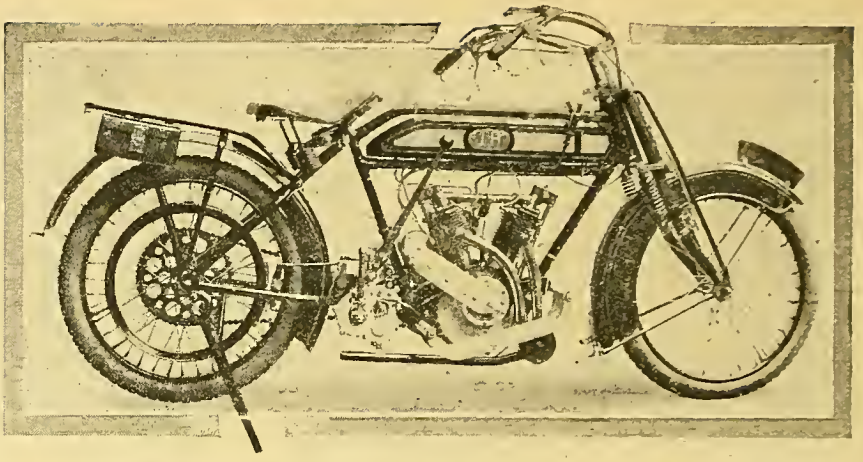
It will be recalled that a Villiers 70×70 mm. engine is used on these sporting little machines, and an Albion two-speed gear is usually fitted.

Touring Machines.

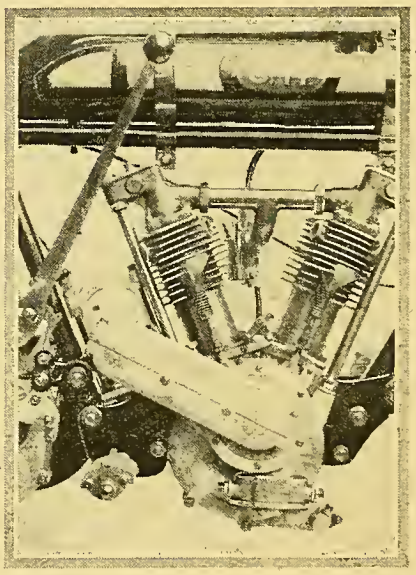
In the case of the heavy touring machines (M.A.G. or J.A.P.) a Sturmey-Archer gear has been adopted for the new models. It will be seen that the footboards are now designed with a double sweep. All heavyweight machines are built with reinforced tubing, and an improvement has been effected in the rear wheel mudguarding. The guard is now 6in. in width, and side valances from the back stays to the chain stays have been added. A Splitdorf magneto has taken the place of the Bosch, and a B. and B. pilot jet carburetter is used as standard.

A Positive Lubricating System.

While at the J.H. works we inspected a very interesting sporting model fitted with 4½ h.p. M.A.G. engine, overhead inlet valve type. This attractive solo mount differed from the standard model in that it was fitted with a neat oil pump of ingenious design. This pump is mounted just below the timing gear, and is instantly detachable. It is driven by worm gearing at a ratio of 24 to 1 from the main shaft, the two plungers of the pump being horizontally opposed, working from a small cam set between them. The bearing on the driving side is provided with a reservoir in which the oil can collect and overflow into the crank case. At the bottom of the crank case is a small sump, containing a gauze filter, which can instantly be withdrawn for cleaning purposes, and from the sump the oil is drawn and forced back to the tank for re-circulation. This neat and simple device provides an efficient and economical way of oiling. Unfortunately, difficulties at present stand in the way of its manufacture.



7 h.p. chain-driven J.H., which is designed mainly for sidecar work. A guard to the chain is fitted, but not shown.



Engine of the 4½ h.p. twin J.H. sporting model. The neat oil pump (connections not made) fitted under the timing case will be noted.

This attractive solo machine is fitted with a chain-cum-belt drive, Sturmey-Archer gear, round sporting tank, fastened with ornamental plated clips, and T.T. bars. The finish is of the same high order as that of other J.H. models.

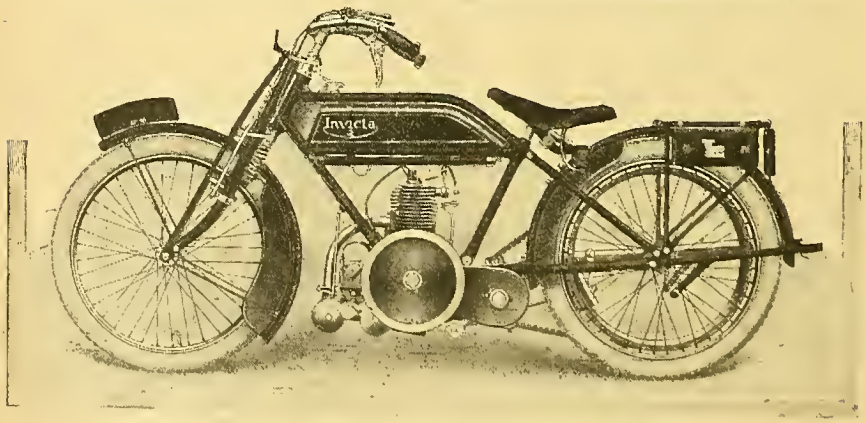
BRITISH MAGNETO FOR 1916 LEVIS.

WE outlined the Levis programme for 1916 on page 395 of our issue of October 21st, but it has now been decided to fit the E.I.C. magneto to the Popular model. This machine is the one upon which Messrs. Butterfields' efforts will be concentrated, and, owing to increased cost of materials and labour, the price of £28 has been increased by 10%.

The new 2½ h.p. with Enfield two-speed gear will be introduced as early as possible. This was fully described in our issue of August 5th, and it may be mentioned that with Roman rims, which will be a standard fitting, the price will be in the region of £46 10s.

A TWO-SPEED INVICTA.

THE single-speed model Invicta, manufactured by Messrs. A. Barnett and Co., Coventry, is well known to our readers, and it will be of interest to announce that a two-speed model is now obtainable. It is identical in every respect to the single-speed model, except that a Jardine two-speed gear is fitted. The chain from the engine to the gear box is entirely enclosed in a neat metal case, and final drive is by belt. The machine is fitted with a 2½ h.p. two-stroke Villiers engine, 70 mm. × 70 mm., Senspray carburetter, and drip-feed lubrication. The complete machine is neat and compact.



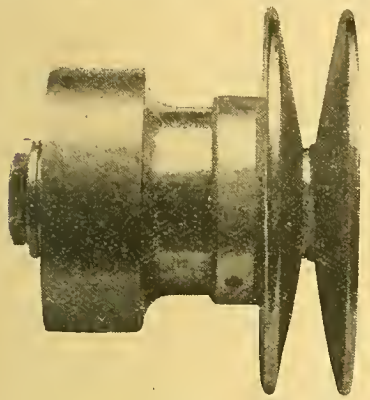
2½ h.p. two-stroke Invicta with two-speed countershaft drive.

Owing to the exceptional conditions prevailing, Messrs. Montgomery and Co. will not market their twin-cylinder horizontally-opposed motor bicycle in 1916, but will devote all their energies to the production of sidecars.

IMPROVEMENTS TO THE PHILIPSON PULLEY.

NO radical alterations are being made in this simple and effective variable speed device, though one or two improvements which will doubtless add to its wearing qualities and general effectiveness have recently been carried into practice. The most important of these is in the new provision made for excluding dirt and grit from the working parts, for, though there is no delicate mechanism about the Philipson pulley, its life naturally depends to some extent upon its weather and dust-proof properties.

During the latter portion of the year the makers have adopted the use of a large rubber buffer, which fits on to the floating portion of the pulley and overlaps the governor portion. Round the buffer a thin metal clip is drawn to prevent the rubber from expanding by



Latest model Philipson pulley. Note rubber buffer bound by thin metal clip.

centrifugal force, and the governor portion of the pulley overlapped by the buffer has been specially turned down so that the dust excluder cannot bind upon it and prevent the free action of the gear. We are specially requested to mention that during the tail end of the summer a few pulleys were sold before the makers discovered that the rubber is apt to expand by exposure to oil, and, while the buffer now used fits sufficiently closely to exclude dirt, its existence cannot hamper the independent working of the two members.

A Longer Screw.

Equally important, so far as the wearing qualities of the device are concerned, is the provision of a longer internal thread by which the floating flange is controlled. It will be recalled that the gear can be set to give any range of gear ratios required, the variation obtained automatically being proportionately the same whether the top gear be set at 3¾ to 1 or considerably lower. It was found, however, that when the pulley was set to give a very low range of speeds, uneven wear occurred owing to the internal thread being only partly engaged, so that a "step" was ultimately formed at the point in the thread at which the wear began. It is obvious, therefore, that with the longer thread this uneven wear cannot occur.

The keyway which carries the floating flange is now being made 1/8in. deeper than hitherto, thus giving greater strength and better wearing qualities.

Since erroneous impressions commonly exist regarding this device, we may mention that it is almost impossible for belt slip to occur even when the pulley is wide open and the belt at its slackest. The tension of the belt, indeed, is of little importance so far as "grip" is concerned, for the strong spring inside the governor of the pulley tends to keep the two flanges tightly pressed together, so that the belt, lying between them, is constantly subjected to the tension of this spring. In other words, the belt is tightly gripped and held between the two flanges, and thus, when running slack on a low gear, the belt simply rides on the top portion of the pulley, instead of being bent round its reduced circumference. Thus it is quite reasonable to think that this system entails less wear upon the belt than if it were run taut on a pulley of fixed circumference, since the belt is never subjected to bending strains at high speeds.

The very considerable success this device has attained in public competition is sufficient recommendation as to its efficiency. Being automatic in action, it is *constantly* in action, and consequently the degree of flexibility attained must effect a considerable saving.

A DOT DEVELOPMENT.

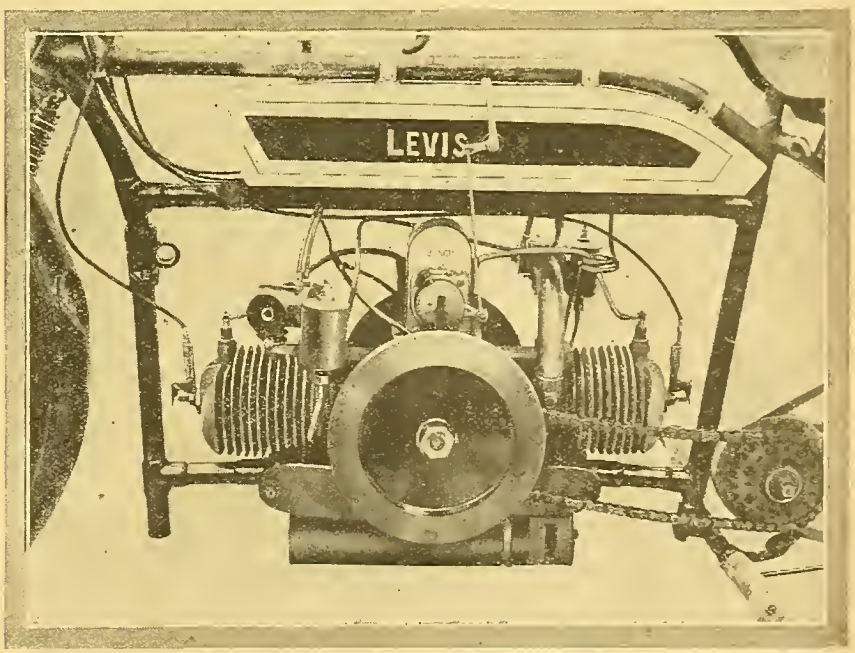
MR. HARRY REED, the well-known speed rider and maker of Dot motor cycles, is at present constructing a novel and interesting lightweight, which is quite a new departure as regards frame construction and seat suspension. The seat is of the hammock variety, and though we are not as yet at liberty to describe the principle of the framework, we may say that it promises well for rigidity and extreme lightness.

Mr. Reed is also busy with an attractive featherweight sidecar, which differs from others of its class, in that the body is sprung on heavyweight sidecar lines; it is, indeed, a heavyweight sidecar in miniature.

The manufacture of Dot standard models is almost at a standstill, though one or two twin-cylinder machines are under course of construction. No alterations are to be made in these mounts for 1916, except that the Overseas models are to be given slightly greater ground clearance than hitherto. The lightweight model is also to remain unchanged, this excellent machine having already reached the maker's ideals as regards simplicity and effectiveness.

MATCHLESS MOTOR CYCLES.

MESSRS. H. COLLIER AND SONS, LTD., though they are only turning out motor cycles in exceedingly small quantities, owing to their works being almost entirely taken over by the Government, have so far remembered the existence of their former business that they have been engaged in designing an interesting spring frame. It has, however, only reached the paper stage, and a trial model has not, up to the present time, been constructed. Still, this shows that when the war is over the new Matchless will be a thoroughly up-to-date mount.



The experimental 6 h.p. twin-cylinder two-stroke Levis engine. There is a separate carburetter for each horizontal cylinder, and there are two outside flywheels. The machine illustrated is an experimental one, which won a hill-climb on its first appearance; when placed on the market it will be water-cooled. The war has hindered its progress.

Motor Cycles in the Lord Mayor's Show.

That the despatch rider is still a public ido. was demonstrated by the cheers which were accorded three military motor cyclists who formed part of the Lord Mayor's Show. They were all mounted on 1915 Triumphs, one of the riders being Sergeant Barker, the well-known competition rider.

A Wounded Despatch Rider.

News is sought by his parents of Corpl. A. Lindsay, R.E., No. 54,326. Corpl. Lindsay was attached to the 11th Signal Company, and his parents received formal notice on August 24th that he was suffering from wounds at a place not stated. Since that date no further information has been obtainable from the War Office, and his parents are naturally anxious concerning him. Any information will be gladly received.

Support from the Front.

Our spring frame campaign has attracted great interest with our numerous readers in the Services. An officer in one of the Motor Machine Gun Batteries, now on active service, says he hopes we shall induce the authorities to adopt a better method of springing for War Office motor cycles, and he thinks our readers are, if anything, too mild in their criticisms. The mudshield problem, to which we have devoted much space on several occasions, is another of those requiring attention, and which, like the springing, will probably be remedied, as our correspondent remarks, after the war!

The Lighting of Street Repairs.

A correspondent draws attention to the very real danger of lighting street repairs by means of red lights. In these days of reduced lights it is very easy, when seeing a red light ahead, to suppose that one is following another vehicle, and possibly to discover the mistake too late to avoid an accident. The whole regulation of lights seems to need much stricter police supervision. Within the last few weeks we have overtaken many cyclists and one or two carts showing a white light to the rear, a large number of both classes with no rear light at all, and innumerable unlighted handcarts, also one cyclist with a red light in front. Such disobedience to the regulations adds much to the dangers of our darkened streets.

The Reduced Lighting Order.

A London judge recently gave thirty yards as the limit distance for a beam of light from ordinary lamps on motor vehicles.

Police Activity.

Last week fines ranging from £10 to £20 were imposed at various London police courts for non-compliance with the lighting regulations, and for driving motor vehicles at an excessive speed. We noticed last week-end that the police were active on the Portsmouth Road between Thames Ditton and Esher.

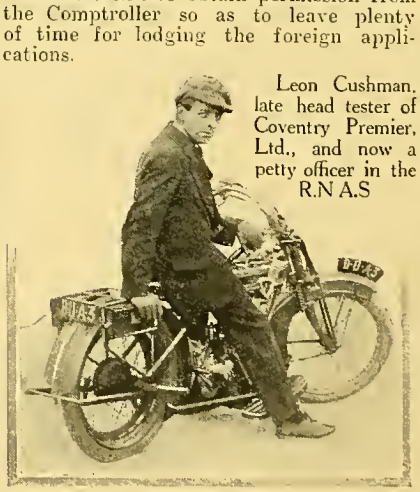
Disc Wheels Popular.

A surprising number of sidecar outfits on S.E. and Kent roads have wheel discs, mostly of sheet tin. One on a Scott combination, seen at Beckenham, had coloured circles on the discs matching the red finish. It suggests colour variations and kaleidoscopic effects like a spinning top.

Foreign Patent Applications. Official Consent to be Obtained before Filing.

Under a new Order in Council, no application may be made for any patent or design registration in foreign countries or the Colonies without the permission of the Comptroller-General of the British Patent Office being first obtained. The requirements are that the request for such permission be filed at the Patent Office with a copy of the British specification, and that the request lie before the Comptroller for one month.

The object of this Order is to prevent foreign patent applications being made on inventions which should be kept secret from the enemy. It renders it necessary for patentees to give instructions to their patent agents much earlier than hitherto, or, at any rate, steps must be taken to obtain permission from the Comptroller so as to leave plenty of time for lodging the foreign applications.



Leon Cushman, late head tester of Coventry Premier, Ltd., and now a petty officer in the R.N.A.S.

Horizontal Two-strokes.

Two more horizontal two-stroke twins, in addition to the several already described in our pages, have been brought to our notice. They differ only in detail from the designs already illustrated. It may be observed here that Messrs. Douglas Bros. some years ago gave their attention to the subject. Promising as the horizontal two-stroke design of engine appears to be on paper, there seems to be a "fly in the ointment."

Average Prices.

We give below the average prices of second-hand models offered for sale in *The Motor Cycle*. Where it is possible to obtain a sufficient number of each model, the average for the past week is quoted. If there were not at least two advertisements, then the last occasion on which they were quoted is given.

Road Improvement in Devon.

The road between Bideford and Clovelly, which has for a very long time been in a notoriously bad condition, chiefly due to the heavy char-à-banc traffic, is now being remade with a substantial stone foundation. It should shortly be in excellent condition.

War Office Motor Cycles.

All motor cycles intended for use by the Royal Engineers Signal Section are now tested by a military officer before being finally accepted by the Government. This new rule is due to certain machines having been turned out in a faulty manner. We fear, however, that the War Office test of a couple of miles, and at the rate of over fifty a day, is not sufficient to detect anything more than superficial adjustments which may be at fault. It is said that this brief test "relieves manufacturers of responsibility."

Tail Lights for Policemen.

This is indeed an era of universal rear lighting. The city police now carry red bull's eyes at the back of their belts. The idea is an excellent one, and has undoubtedly saved many policemen's lives.

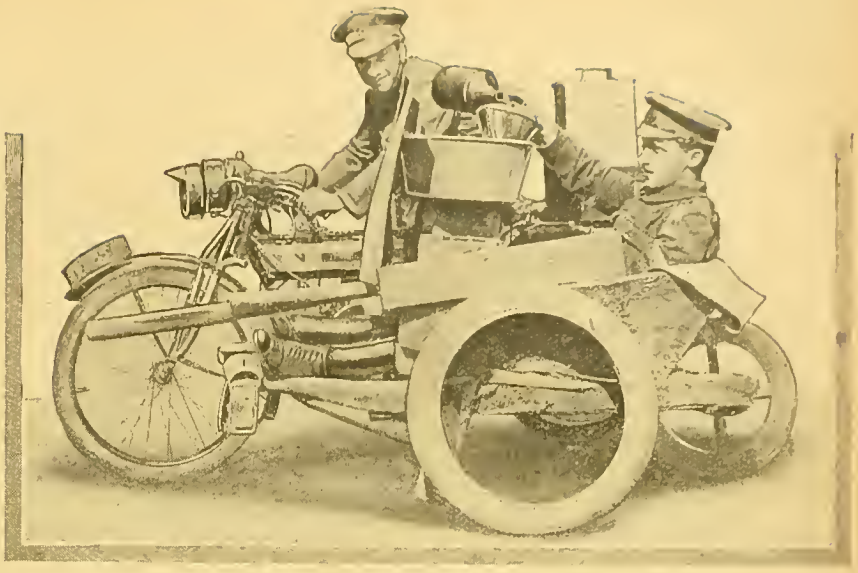
Another development is the marking of the constables on point duty with a broad white band about the left cuff, so that the drivers of vehicles may distinguish in the gloom the official arm when upraised to control the traffic.

Motor Cycling in Holland.

The war has affected motor cycle agencies and trade circles in Holland very considerably. The fact of there being no goods to handle has seriously jeopardised the state of the motor cycle trade in that country. The public, we are assured by our correspondent, is willing enough to buy, since, not being involved in the war, the Dutch are, financially, rather strong. Our correspondent mentions that he has on order a Rudge-Multi from the Dutch agent, and has already waited several months for it. The lot of existing motor cyclists is not altogether happy, for tyres also are now very difficult to obtain.

The Cycle and Motor Trades Benevolent Fund.

As last year, instead of the customary banquet, an appeal is being made by Mr. H. Smith, the President of the Council, for funds to carry on the good work. During the past year 140 applicants benefited to the extent of £2,700, and upwards of £100 was given to hospitals. The year's subscriptions amounted to £1,600 odd, so it is hoped that the donations will be large. The annual general meeting will be held at the Connaught Rooms, Great Queen Street, W.C., on Wednesday, the 15th December, at 5.30 p.m., and will be followed by a meeting of the council.



THE LIGHTER SPIRIT BEHIND THE FIRING LINE.

Latest pattern motor machine gun "sidecar," as designed and built by some R.E. despatch riders serving in France with the B.E.F.

Motor Cyclists and Lord Derby's Scheme.

We are officially informed that motor cyclists on the different waiting lists of the Royal Engineers are not exempt under Lord Derby's scheme, but must consider themselves free agents. Such men would, after November 30th, be in the same position as other single men who may not have presented themselves for enlistment

Light Cars n 1916.

Wednesday's issue of *The Light Car* contains the annual Buyers' Guide, which should be of interest to many of our readers in view of the number of light car recruits obtained from the ranks of sidecarists. The Guide is a complete list of the whole of the light cars at present on the British market, with prices and all essential dimensions and particulars. Three-wheelers are included, and an article of considerable interest in the same issue is "The Light Car of To-day," written by the editor of *The Autocar*.

"Imitation the Sincerest Form of Flattery."

Having copied practically all the features which have earned for *The Motor Cycle* its present popularity, a contemporary this week recapitulates our leaderette on "Double-seated Sidecars," which appeared in the last issue of *The Motor Cycle* (and which, by the way, was inspired by the new Scott Sociable which was dealt with exclusively in this journal). Not content with that, the same journal introduces a new (?) feature—"Average Prices of Second-hand Models." No wonder an excuse is deemed necessary!

Next Week's Buyers' Guide.

The annual Buyers' Guide of 1916 models, to appear in our next issue, will this year be set out in original form, and illustrated. *The Motor Cycle* Buyers' Guide is an invaluable work of reference; its utility in past years has been proved over and over again. It is an issue filed for reference throughout the year by manufacturers, agents, and users at home and abroad.

The National War Funds

At the week-end the principal war funds stood as follow:

The Times Fund for the Sick and Wounded	£1,876,775
The Queen's Work for Women Fund	166,926
The *Weekly Dispatch* Tobacco Fund	89,119
The Belgian Relief Fund (exceeds)	1,090,993
Daily Chronicle Christmas Gift Fund	9,780
Daily News Christmas Gift Fund	10,500

No Special Privileges to Wearers of the King's Uniform.

George Condy, a petty officer in the R.N.A.S., who was fined £4 for exceeding the speed limit, and 5s. for driving without a licence, stated at the West London Police Court the other day that he was taking an urgent message for the Admiralty. Mr. Fordham stated that he had received a letter from the Admiralty which said that there had been no necessity for the defendant to have exceeded the speed limit.

THE most important one-day reliability trial ever held in South Africa was that organised last month by the Cape Peninsula M.C.C. It was held over a course of 210 miles, which included the climbing of mountains and the wading of flooded rivers. The prize was the Barling Cup, and the fact that it is the last trial of importance for some four or five months added interest to the proceedings.

There were a dozen starters—six solo and six sidecar mounts—and the start from Cape Town was made at 6 a.m. An early start was necessary in view of the distance to be accomplished, and the average speed set of twenty-four miles an hour was on the high side. Two hundred and ten miles in the day in England is a fair mileage, but over Colonial roads and in bad weather it is a severe test. Likewise the percentage of adventures was much higher than would

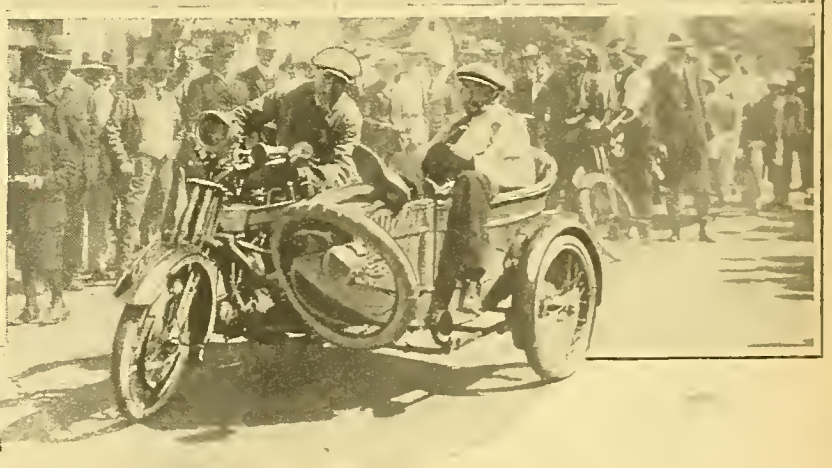
occur on our roads. The ascent of the Bainskloof Pass over a road with six inches of mud called for more than ordinary skill, but the great test was crossing the flooded Breede river, the height of which at the time of the trial was abont three feet and the distance across at least thirty yards. Naturally, there were trying times on the other side when it came to restarting the engines. One competitor emptied a quantity of water out of the crank case of his machine, and two others spent two hours unravelling the mysteries of a waterlogged magneto of the waterproof pattern.

The luncheon halt was at Villiersdorp (125 miles out), and at 5.15 p.m. the first man arrived home. Results proved that three men tied for first place, their names being E. W. Watts (8 h.p. Enfield), J. B. Elliott, and J. F. Smuts (P. and M.). Fourth place was taken by J. Hunter.

5

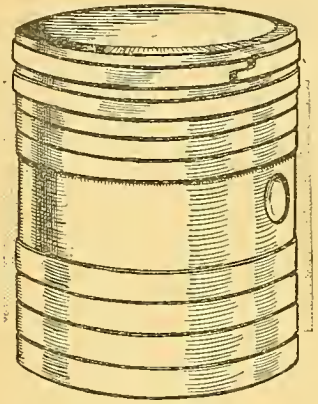


8

J.A.P. ENGINES IN 1916.

BETTER BALANCE AND IMPROVEMENTS TO GUIDES AND BEARINGS.

SOME interesting improvements in J.A.P. engines have been recently introduced. Some of these have been dealt with before, but in reviewing next year's models it is advisable to deal with all the principal points of interest. The chief engines to be manufactured during 1916 will be the 2½ h.p. single, 70 × 76 mm. (292 c.c.); the 3½ h.p. twin, 70× 64.5 mm. (496 c.c.); the 5h.p. twin, 70×85 mm. (654 c.c.); the 6 h.p. 76 × 85 mm. (770 c.c.); the



Piston of the 2½ h.p. single-cylinder J.A.P. Note the increased bearing surface and the oil retaining grooves.

3 h.p. Morgan engine, with special magneto fixing, the magneto being carried on a special bracket in front of the crank case, and bevel driven, 85 × 85 mm. (964 c.c.) air-cooled; the 8 h.p. water-cooled; and the cycle car engine with heavy crankcase 85 × 95mm. (1,078 c.c.) It is interesting to note that the manufacture of the short stroke engine, which had a bore of 90 mm. and a stroke of 77.5 mm., has been discontinued, and all J.A.P. engines are now of the long stroke type.

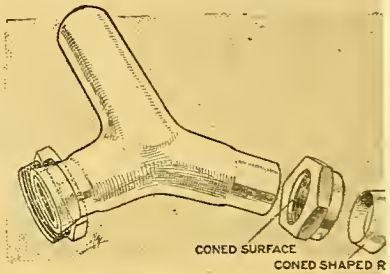
The chief improvements in all models are a decided bettering in balance, a new type piston, new big ends for the twins, and adjustable tappets. The first named point we have had opportunities of noting on recent road tests. One of the accompanying illustrations shows the latest piston of the 2½ h.p. model, which has been considerably improved in design, being light, and having a much larger bearing surface than formerly. The number of oil retaining grooves will also be noticed. The 2½ h.p. has been fitted with a new pattern cylinder, the cooling surface of which has been considerably increased, the radiating fins being of much larger dimensions. Both valves and valve ports are larger, and the latter are now of the streamline type.

To Exclude Air.

The inlet valve guide is of cast iron, with a series of internal grooves cut in its inner surface. It is afterwards reamered out to standard size, allowing a clearance of only .002 of an inch. The object of the design is to collect the oil in the grooves, which shall lubricate the stem, and, at the same time, exclude the air. Particular attention has been given to the prevention of air leaks at the carburetter and induction pipe unions.

It may be remembered that the usual practice is first of all to slip the nut over the inlet pipe and then braze a flange over the end of the pipe. Engines vary just a shade, and if there is not a good fit there is a danger of the rider, after taking down his engine, screwing up the union so tightly that the flange is broken off. Also, it is exceedingly difficult to keep such a joint airtight. Messrs. Prestwich and Co. have overcome the difficulty by making a cone practically driving fit over the end of the pipe, a by turning the inside of the union nut fit the cone exactly. The result is t the thin edge of the sliding cone is tightly pressed over the union that is excluded, and an exceedingly sec fitting is obtained. This method sho be most effective, and should overco the difficulty many motor cyclists exp ence, which can be only overcome the unsightly process of wrapping insul ing tape round the unions.

One of the most interesting innovati in the 1916 J.A.P. engine is the impro ment in design of the big end bearin which we illustrate herewith. A di culty which is experienced in designi the big end is to get sufficient bear surface with the small amount of a available to withstand the power thr



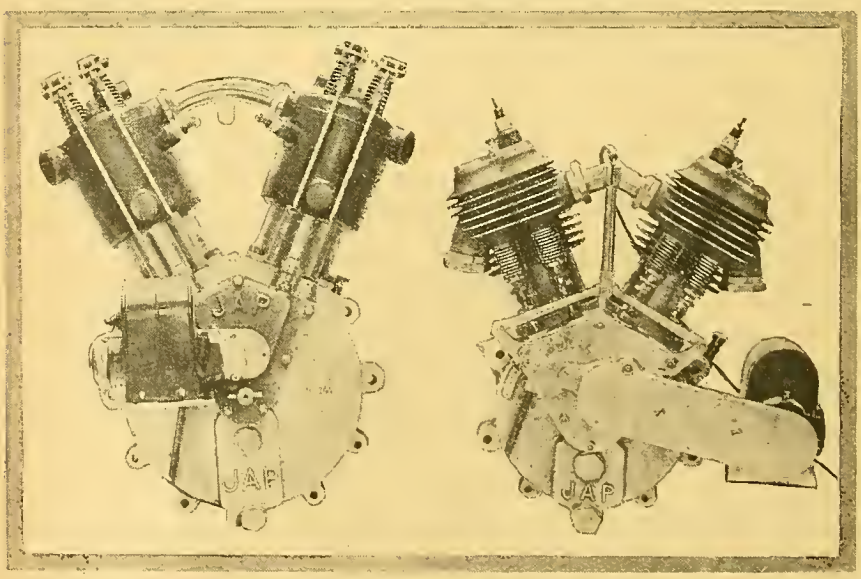
The J.A.P. air-tight induction pipe union.

of two powerful cylinders and the iner stresses which occur at speeds, and keep the bearings adequately lubricate

Messrs. Prestwich have adopted t forked and centre rod principle, wh is probably the best, as there is binding strain due to the connecting r being out of centre with the piston. will be noticed, on referring to t sketch, that a phosphor bronze bu passes through one side of the fork r to the other, while the centre rod wo directly in the centre portion of the bu This design allows a greatly increas bearing surface. The chief improveme is in the design of the bush, which composed of steel lined with phosp bronze. The centre rod in this case h also a phosphor bronze bush and wo on the outside of the steel bush.

In the case of a heavy twin engi one of the greatest troubles is that overheating. This is overcome to a great extent by fitting extra radiating fins, but the exhaust valve cap is not usually provided with any means of radiating the heat. The accompanying sketch shows the J.A.P. method of overcoming this defect, by the insertion of star-shaped fins which considerably assist the cooling of the exhaust val cap.

Radiating fins on th exhaust valve cap the 8 h.p. J.A.P. twi engine.



1916 J.A.P. ENGINES. (Left) The 8 h.p. water-cooled cycle car engine (as used on Morgans) and (right) The novel external exhaust valve lifter on the 4-5 h.p. twin.

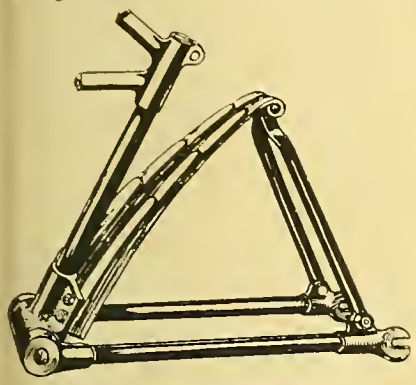
MORE SPRINGING SYSTEMS.

Progress of "The Motor Cycle" Campaign.

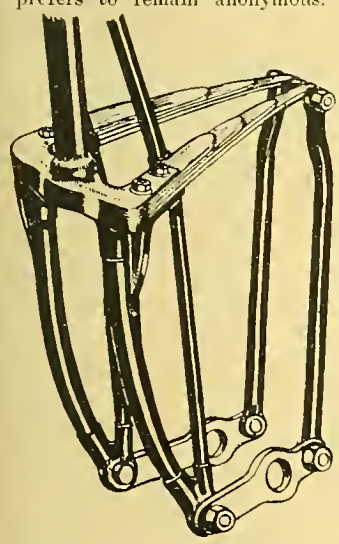
"The Motor Cycle" campaign in favour of spring frames continues to grow in volume—every week brings us new ideas from our readers, who, as well as manufacturers, are taking great interest in this subject. We shall continue to give publicity to all promising designs which may reach us.

The Double Leaf Spring Frame.

THE novelty in this design consists only in using two leaf springs where one is generally employed, the object being to produce the triangulation which will have the effect of causing great lateral rigidity. It is intended that the chain stays should be mounted on the bottom bracket in ball bearings; in other respects the drawings are self-explanatory. There are no slides, and the joints are not numerous. The designs were submitted by a keen reader who prefers to remain anonymous.



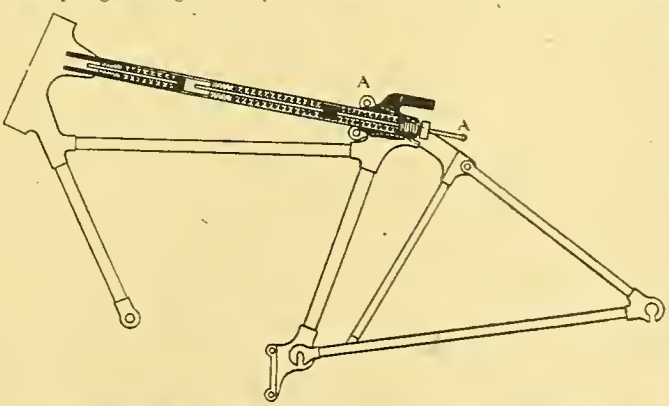
A form of triangulated rear springing.



Front forks of similar design.

Another Adaptation of the Palmer System.

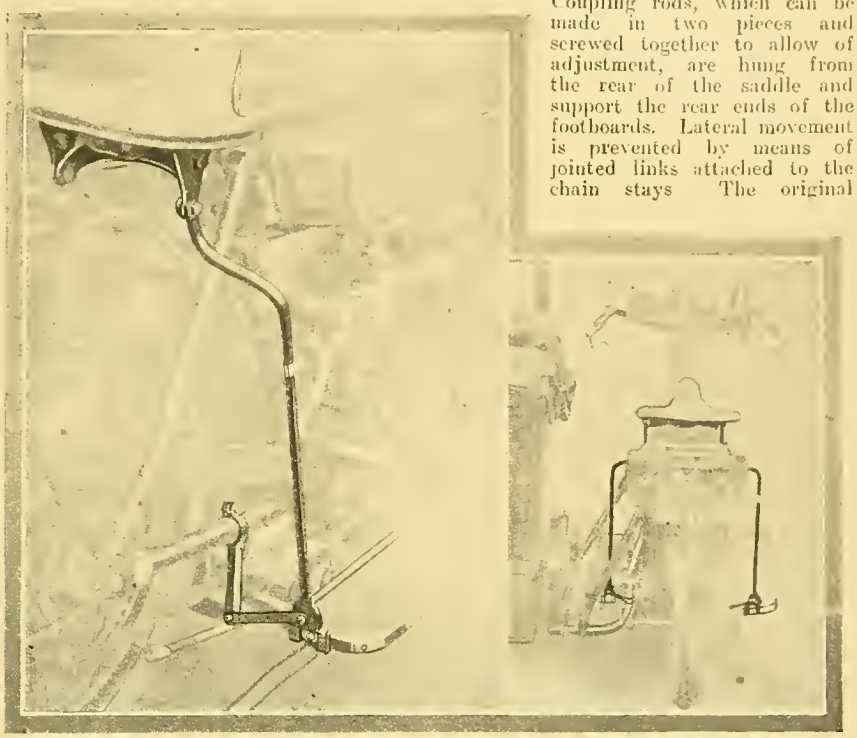
MR. PALMER has still another adaptation of the spring frame which we have already described and illustrated, in which the recoil and rebound springs are placed in the top tube of the motor cycle. Beneath the saddle are slides which are gripped by horn plates. The rod carried by the springs is attached to the horn plates by links, or springs in tension. The sketch, which is only diagrammatical, explains itself. It is, of course, obvious that the top tube must be a straight one when this system of springing is employed, but this is a method of construction which is gaining in favour. This construction has the advantage of neatness, the springs being entirely enclosed.



The Palmer springing system. The points A A are connected on each side of the frame by means of links which push the sliding rod.

Spring Support for the Rider.

THE accompanying illustrations show a method, designed and patented by Mr. G. Thomson, of Gilcomston, Aberdeen, of springing the saddle and footboards of a motor cycle. Coupling rods, which can be made in two pieces and screwed together to allow of adjustment, are hung from the rear of the saddle and support the rear ends of the footboards. Lateral movement is prevented by means of jointed links attached to the chain stays The original supports of the footboard are, of course, removed. In the illustrations the coupling rods are shown bent. This is to clear the sidecar attachments; on a solo machine they would probably be made straight. The front of the boards can be supported on the small springs at present used on the Enfield machines; but almost the whole weight of the rider appears to be supported on the saddle springs, and about two inches of springing movement is available. The same system can be applied to footrests. It is a well-known fact that the passenger is far more comfortable than the driver of a sidecar.



A system of interconnecting the springing of saddle and footrests patented by Mr. G. Thomson, and described on this page. The arrangement is shown fitted to a 6 h.p. Enfield sidecar outfit.

"THE MOTOR CYCLE" RECRUITING SECTION.

Latest Enlistments in the Motor Machine Gun Service. A.S.C. Closed.

A FURTHER inspection of recruits for this branch of the service was held last week, the following being among the men accepted :

G. W. Almond (Coventry).
J. Baldock (Coventry).
J. T. Birch (Birmingham).
P. Brewster (Hertford).
C. Capstick (Bolton).
R. Couzens (Sheffield).
H. Craddock (Birmingham).
A. H. Driver (High Ferrers).
H. Ellocott (Cardiff).
G. M. Hall (Ashford).
A. Higginbottom (Hyde).
A. J. Hunt (Johannesburg).
W. A. Hunt (Saltley).
F. Johns (London).
I. J. Linnett (Coventry).
H. Lord (Bacup).
F. Lomas (Rhodesia).
C. R. Mackenzie (London).
E. J. Riley (Hull).
F. H. Sneat (Elsdon).
J. Storey (Elsdon).
J. R. Strachan (Canonbridge, N.B.).
C. V. Toms (Nottingham).
C. H. Unbeham (Java).
G. Wallis-Bone (London).
C. A. Weatherill (Holton le Moor).

The enthusiasm which exists among motor cyclists anxious to serve their King and Country is remarkable. Of the above it is interesting to note that C. H. Unbeham (Java), A. J. Hunt (Johannesburg), and F. Lomas (Rhodesia) paid their own passages home specially to enlist in the M.M.G.S. Gunner Unbeham's passage cost £60, and he enlisted at 1s. 2½d. per day. He is an expert motor cyclist, having driven a sidecar in the Celebes (Straits Settlements) in parts where motor cycles have never previously been seen.

W. A. Davenport, formerly artificer-sergeant attached to the No. 5 Battery, M.M.G.S., who, as mentioned in *The Motor Cycle*, has had a very long illness, from which we are glad to say he has now practically recovered. In pre-war days Davenport was a well-known Lea-Francis rider.

As the Motor Machine Gun Service is now up to strength as regards car drivers and mechanics, no further applications for these positions can be dealt with until a further announcement appears in *The Motor Cycle*. Recruiting generally for the Army Service Corps (M.T.) closed last Thursday.

The total number of applications dealt with by the Editor of *The Motor Cycle* from motor cyclist recruits totalled 5,515 at the week-end.

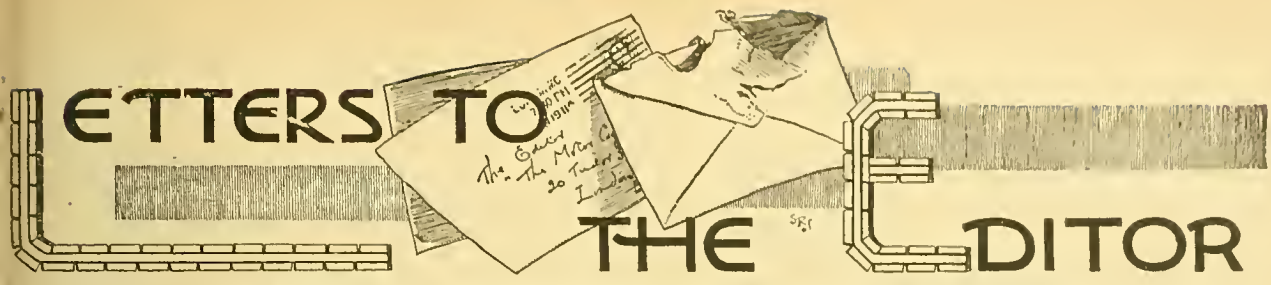
Yesterday (Wednesday) further recruits for the M.M.G.S. from all parts of the country were to be examined.

The next inspection is on Wednesday, the 24th inst., at the Coventry Recruiting Office, Masonic Hall, 2.30 to 4 p.m. Experienced motor cyclists who are medically fit should write to the inspecting officer, Mr. Geoffrey Smith, 19, Hertford Street, Coventry, mentioning age, height, and experience, *and when free*. A railway warrant will be issued to suitable applicants. Only a limited number of recruits may be accepted.

Recruits cannot be accepted under Lord Derby's Recruiting Scheme, *i.e.*, to join at once and be called up for service when required.

E. G. Firkin (late advertisement manager of the Triumph Cycle Co., Ltd.) and Arthur Gough, of Coventry, are among recent recruits in the A.S.C. (M.T.)

The sergeants' mess at the training centre of the Motor Machine Gun Section.



The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," Hertford Street, Coventry, and must be accompanied by the writer's name and address

A Trial for Armlet Wearers.

Sir,—I most heartily agree with Mr. E. R. Troward's suggestion for a trial for armlet wearers. Might I suggest that the trial be for both Services, although it does not appear clear whether the discharged Naval men are to receive an armlet. As your correspondent points out, there must be a very large number of men eligible for a trial of this kind, and I, for, one hope his suggestions will be heeded. H. T. CHAMBERS (late P.O., R.N.A.S.).

Comforts for the Royal Flying Corps.

Sir,—With reference to your article in *The Motor Cycle* of November 4th, I would like to draw your attention to the Military Wing of the Royal Flying Corps, in which numerous motor cyclists have enlisted.

This corps is composed of men drawn from all parts of the Empire, and, consequently, there is no regimental fund or county association to provide the comforts, which are so much appreciated by the men at the Front.

Lady Henderson at the beginning of the war, acting on the suggestion of Major-General Sir David Henderson, Director-General of Military Aeronautics, started to collect sufficient funds to send out to each man such comforts which, in the ordinary way, would have been supplied from their own regiment or county.

In view of the large number of motor cyclists who have enlisted in this corps, I feel sure from among your readers there are many who would be glad to send something towards helping the splendid work that Lady Henderson is doing.

Subscriptions would be most gratefully accepted, and should be sent to

Lady Henderson, honorary treasurer,
Surrey House, Marble Arch,
London, W.

The Royal Flying Corps has increased enormously during the last year, and in consequence the demand on the resources of the fund is much greater. At this time of the year the work is particularly trying, and the mechanics are busy day and night with the care and repair of the machines, on which the lives of the fliers depend. B. MARIANS.

The Lady Motor Cyclist—A Protest.

Sir,—If you will allow me space in your valuable paper, I should like to answer the protest against rational dress for motor cycling.

Your correspondent, Mary Reid, must forget that perhaps nearly 50% of the ladies who ride use high-powered sidecar machines, which, with the exception of the Scott, have diamond frames. Also many riders of lightweights prefer, as I myself do, a diamond frame for various reasons. Then why should women be called "bold and mannish" and other pleasant things! for wearing what is after all only a neat and serviceable costume? Our brave nurses in Serbia and also our women transport drivers at the Front wear breeches, and also in the hunting field the larger proportion of women are dressed very like the men and ride astride.

As Mary Reid looks so graceful on her machine she is certainly to be envied, but many women ride for the joy of the sport alone, and so are satisfied if they look neat and serviceable. FRANKETTE.

Sir,—A correspondent in your issue of November 4th, signing himself "Dreadnought," makes a protest against ladies riding motor cycles other than those specially constructed for their use. Probably the majority of lady motor cyclists drive sidecar outfits. In my own case, my wife is pleased to give me a rest occasionally by driving herself, and by doing so I cannot agree that she provides an exhibition or loses her self-respect. As a matter of fact, the average man's machine can be ridden with ease and decorum by any woman, provided her dress is not unduly restricted.

Although always interested in lady motor cyclists, I have never yet noticed, either on the road or in the press, the exhibitions your correspondent mentions, and I consider his complaints are exaggerated.

It seems doubtful whether the specially constructed ladies' machine will ever become popular, except in lightweight sizes, owing to constructional difficulties.

Generally speaking, in machines of 3½ h.p. and over, there is not too much room for the removal of cylinders, and in an open frame machine the accessibility is reduced.

Again, an open frame cannot be made as strong as a closed pattern frame of the same weight, as the strength of a frame is proportional to its depth. In a motor cycle all the strength available is required.

It is interesting to learn that your correspondent has been associated with clubs, which attempted to dictate to ladies the type of machine they were to ride, but one would imagine that any club which indulged in such interference would be left severely alone by the fair sex. LK 2994.

[Has our correspondent ever seen a Scott?—ED.]

Petroil Lubrication.

Sir,—As I am the writer of the letter criticising petroil, referred to by your correspondent Dr. T. S. Logan, perhaps you will allow me a few words in reply.

I am prepared to admit, for the sake of argument, that the use of petroil mixture as a method of lubrication is probably as efficient for that purpose as any other system, if one can call petroil a system. What I complained of was that it involved certain disadvantages in riding which were successfully overcome by fitting a Knight lubricator. I will enumerate them in order:

(1.) The messiness of petroil. The splashing of minute quantities of pure petrol through the hole in the filler cap when the tank is full is hardly noticeable. With petroil, however, the oil is left behind on evaporation, and manages to absorb dust and dirt and penetrate everywhere. I want to lubricate my engine; I object strongly to the lubrication of my overalls and exterior person.

(2.) Inefficient carburation. A carburetter is not designed for passing lubricating oil, and cannot be expected to behave as well as with pure petrol. I find with a Knight lubricator I can use a smaller jet and get nearly twenty more miles to the gallon than I could with petroil.

(3.) Difficulties in starting, owing to the fact that on the evaporation of the petrol part of the mixture in the carburetter the oil would remain and frequently gum up the jet, so that I have had to take it down and clean it before I could get the machine to take any air. These troubles are now absolutely over.

(4.) Time and trouble. The mixing process takes time, and is far from agreeable. All I do now is to see that there is sufficient oil in the tank, turn on a tap, and turn it off when I stop. The hotter the engine gets, the more oil it uses. My Connaught, good before, has, in my opinion, been greatly improved.

No! the petroil method is one of those unscientific short cuts so popular in England, but it will not survive.

H. L. LEWIS.

Tubing for Acetylene Gas.

Sir,—I notice a letter in the issue of October 28th from Mr. A. B. Cousins commenting on my remarks on tubing for carrying acetylene gas to the rear lamp. May I say that copper tubing was recommended in an article which appeared in a paper (not *The Motor Cycle*)? The Bowden casing is excellent for this purpose, its greatest points being that it does not perish, is flexible, lends itself to clipping better than rubber, and is not liable to get pinched. I have used the casing some considerable time and have found it most satisfactory. Of course it must be fitted with short rubber connections.

MAY WALKER.

Water on the Knee.

Sir,—I have been in the habit of using my motor cycle in all weathers and at all seasons for long week-end runs during the last three years. For some time past I have been troubled with occasional swelling of one knee joint, and now I am suffering from water in both knees. My doctor advises me to give up motor cycling, which I am very loth to do, and I can scarcely afford a two-seater car with petrol costing about a penny a mile. I wonder if any of your readers have had a similar trouble to mine, and, if so, do they blame motor cycling for it? I have had no accident that would account for the trouble, but I have travelled fast whatever the temperature, and the proofing of my overalls has been decayed for a long time now, so that it is possible that my knees have been getting warmed by the 7 h.p. twin underneath, and chilled by the blast of air in front, thus setting up rheumatic inflammation. I shall be very pleased to hear any of your readers' views on this point.

MEDICALLY UNFIT.

Two-stroke Lubrication.

Sir,—I am now riding my fourth two-stroke machine. This is the first one on which petroil has been the system of lubrication used. I find that owing to blow-back from the carburetter the lower half of the cylinder and the whole of the crank case gradually become covered with oil. The oil then collects dust and the engine invariably looks dirty.

Another reason for my dislike of the petroil system lies in the fact that when ascending long gradients, or even riding against a strong breeze, I am unable to give just that small extra drop of oil which cools the engine and inspires confidence in likelihood of the bearings receiving their share.

Have any of your readers tried a separate oiler which does not enter the engine by way of the carburetter? Would it be advisable to drill and tap the cylinder wall and take a pipe with "drip feed" from the tank to this place?

I shall be glad of the opinions of any two-stroke riders who have made alterations similar to that suggested above.

E.M.

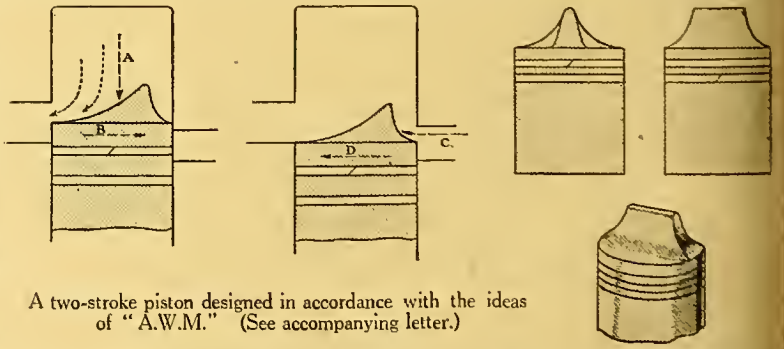
Engine Rattle in Two-strokes.

Sir,—I have read with interest the comments on above in *The Motor Cycle*, but up to now nothing definite has been proved to be the cause of this mysterious complaint. I have an idea which, if carried out, might solve the problem.

In the first place, referring to sketch on left, the burnt gas, in passing into the exhaust pipe, exerts a pressure as indicated, the chief direction concerned being that indicated by arrow marked A, which tends to force piston in the direction B. Then in the next sketch the pressure of exhaust gas has sunk to practically nothing, while the inlet gas is at full pressure and charges against the top of piston, as indicated by arrow marked C, forcing the piston in the direction D. Thus we have a back and forward motion set up in the piston owing to its contour, which at high speeds might reasonably be expected to indicate itself by the rattle in question.

My idea is that contour of piston top be made as sketch on right, allowing for two exhaust ports opposite each other and two inlet ports opposite each other, and thus getting rid of uneven pressures on the piston.

A.W.M.



A two-stroke piston designed in accordance with the ideas of "A.W.M." (See accompanying letter.)

Air Leaks.

Sir,—Although I have not put this idea into practice, I think a small packing gland placed at the bottom of the valve guide would effectually prevent all air leaks through the guide and improve the slow running qualities of an engine.

T.T.

Broken Spokes.

Sir,—I owned a 7-9 h.p. twin of 1914 make which occasionally broke a rear spoke or two at the bend. My 1915 model of the same make was a still great sinner. Rebuilding the wheel did not cure the trouble, nor did a new wheel from the makers. Other owners of similar machines in this locality are bothered by this spoke-snapping pest, but not to the same extent as I am. I am a thoroughly experienced driver, but the roads about here are of the Six Days Trial order. I would be glad to hear if readers have found any cure for this most aggravating trouble. I suppose a new hub with bent spoke flanges and straight spokes would effect a cure. Why on earth will makers not make their hubs so that spokes can be replaced with the wheels *in situ*?

WILD.

Dangers of the Darkened Streets.

Sir,—Now that our streets are so exceedingly dark at night, may I be permitted, through your columns, to beg pedestrians, for their own safety, not to walk along in the roadway, so long as there is a reasonably good path alongside which they can use?

I am a motor cyclist, engaged on Government work at Woolwich, and every night in the course of my six-mile journey home I pass a considerable number of people walking along in the roadway, quite regardless of the fact that they cannot be seen by approaching traffic. It would appear to be a prevalent idea among pedestrians, who probably have not seriously considered the matter, that a motorist's lamps still enable him to see objects some way ahead of him; but I would point out that this is not the case at the present time, no matter how slowly he may be travelling. Khaki is especially difficult to see at night.

Driving home every night through almost unlighted streets, after long hours at work, is already quite enough strain for one's nerves, without the added danger of unlighted pedestrians walking along in the road. If a man specially desires to walk in the road, I should suggest that he carry in his hand something white, such as a paper or a handkerchief; though even this would be almost invisible, it would be better than nothing at all.

May I also appeal to drivers of vehicles of all kinds, horsed ones especially, to have lamps on *both* sides in front, with a *separate* red lamp at the rear? The usual offside lamp with a red glass at the back is quite invisible from behind, if the road curve slightly to the left; in many cases, too, such a light is obscured by the rim of the wheel or by an overhanging load, though technically a red light is there. At a cross-road, if only the one front lamp is carried, a vehicle is quite invisible to anyone approaching from the driver's left. Further, lamps on vehicles should be placed at a reasonable height only, as on a car or taxicab. One frequently meets vans or lorries with their lamps placed very high up—motor 'buses also being great offenders in this respect—with the

TAN LEATHER M.C. COSTUME.

Best Quality Tan Chrome Skins, lined camel fleece.

A magnificent costume for Winter Riding.

The Cheapest Way to BUY EXPERIENCE

Every purchaser of this book gets the benefit of the accumulated experience of many hundreds of thousands of motor cyclists during the past fifteen years.

It is a storehouse of useful information, compiled with care and discrimination for the benefit of all users of motor cycles.

¶ In the present Edition the chapters dealing with the Carburetter, Transmission, and Gearing have been carefully revised and enlarged, and are a most important feature of the edition.

¶ The Chapter on the Two-stroke Engine has also been enlarged, and practically every Two-stroke Engine on the market is now described.

¶ Gas and Electric Lighting, including Rear Lighting, are dealt with very fully.

¶ A useful feature is a table of comparative running costs.

"MOTOR CYCLES AND HOW TO MANAGE THEM" is unquestionably the best and most complete handbook on motor cycles, their care and management. The first edition was issued as far back as 1900, since when it has always been regarded as the standard handbook, and no fewer than sixteen editions have appeared.

Every new edition has been carefully and thoroughly revised to keep pace with the mechanical and other changes that have taken place, until, at the present time, the book is a complete and reliable compendium of motor cycle knowledge, invaluable alike to beginner and experienced rider.

The sixteenth edition, revised (now on sale), is a great improvement on its predecessors, and deals with a multitude of subjects relating to all types of motor cycles.

The buyer of a second-hand machine will find the book equally useful, as it describes old type carburetters, ignition systems, etc., in a special chapter on second-hand motor cycles

LADY RIDERS

who wish to acquire the knowledge that will enable them to manage their own mounts, and thus become independent of outside help or advice, will be well repaid by a careful study of this book.

Sixteenth Edition (Revised), Now on Sale.

result that unless one be on a very familiar road, it is very easy at a distance to mistake their lights for those of street lamps.

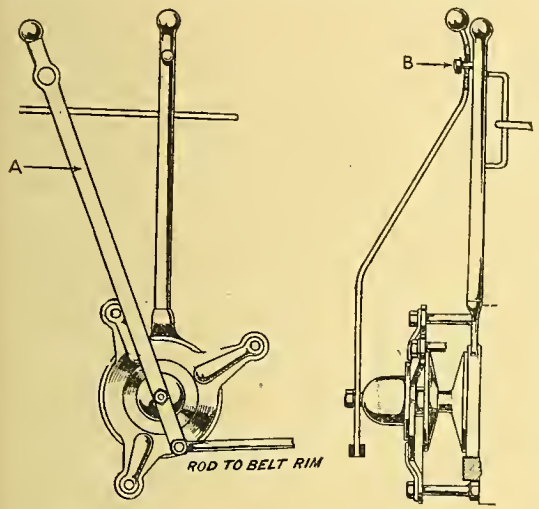
I feel sure that this state of things is simply the result of thoughtlessness, and therefore, in the interests of public safety, I venture to call the attention of your readers to these points.

A MEMBER OF THE ILLUMINATING ENGINEERING SOCIETY.

A Home-made Clutch.

Sir,—A small alteration which I have effected to my 3½ h.p. Rudge-Multi and sidecar may be of interest to your readers. It is a T.T. clutchless model, and I found it somewhat annoying to have to dismount if compelled by traffic, cattle, etc., to reduce my speed to a crawl, as, of course, the lowest gear of the Multi is only about 7½ to 1.

I disconnected the flat rod connecting the engine and back wheel belt pulleys, and fitted the arrangement shown in



Home-made clutch fitted to T.T. model clutchless Rudge-Multi by a correspondent, Mr. J. Douglas.

sketch. The lever A is of flat strip, pivoted on the engine pulley cover as shown, the centres of this pivot and the usual Multi gear lever being coincident. From the bottom of the lever A a rod is connected to the usual bell crank and plunger rod operating the back belt rim. The top of the lever A is slipped over a stud B, screwed into the usual gear lever, as shown.

Now on moving the Multi gear lever along its quadrant in the usual way, lever A also moves with it, and operates the front and back belt pulleys just as though the usual arrangement were fitted. But at will, lever A can be slipped from its stud and moved forward or backward independently of gear lever, this movement tightening or slackening the belt by opening or closing the back belt rim.

If the gear lever is in the lowest gear notch of quadrant and the lever A is moved forward independently the belt becomes slack; this allows it to slip considerably, thus acting as a clutch. On gradually drawing the lever back the belt is tightened, and the drive is again taken up until, with the lever again on its stud, the belt is at its normal tension, and no slip occurs. I find that this arrangement acts as a perfect clutch, and enables me to proceed at a crawl, turn round, etc., just as though an ordinary clutch were fitted. I do not claim that it entirely takes the place of a clutch, of course, but it does all that a clutch is usually used for, except starting from a standstill.

Further, I can, by its use, tighten the belt temporarily on a bad hill, should the belt slip, by simply disengaging the lever A and pulling it backwards, the gear lever, of course, remaining in place in the quadrant. I do not find the belt suffers to any extent, though, no doubt, it would shorten the life of the belt if used excessively.

J. DOUGLAS.

Red Lights on Street Repairs.

Sir,—May I draw your attention to the menace to night riding caused by the use of red lamps for indicating street repairs? When riding I have had several narrow escapes by mistaking these lights for the rear lights of cycles. If lights of another colour, say purple or green, could be instituted universally to indicate street repairs, I think this danger would be obviated.

W. IVEY.

Reversing a Scott.

Sir,—*Apropos* of Scotts firing backward, I owned one of the first Scotts built—a 1909 machine, with water-cooled heads only. On one occasion this machine was baulked on the White Hill, Henley-on-Thames, and started to run backwards. I engaged the low gear, when the machine started violently, ran backwards with considerable impetus, and turned over, sidecar and all; fortunately, no damage was done. Curiously enough, this was the only occasion on which this happened, and although I tried I could not repeat the performance. At the time of the accident ignition was fully advanced and the throttle well open. This Scott would pull a heavy coachbuilt sidecar with three up at about 40 m.p.h., and climb a 1 in 8 hill with ease when I sold it last year.

E. RIDER TROWARD.

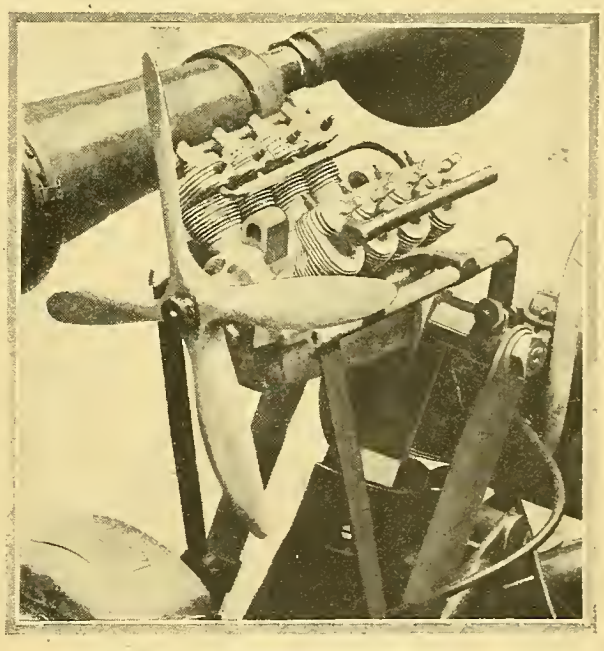
An Open Exhaust.

Sir,—Some few weeks ago "Ixion"—to whose delightful weekly talks I am sure *The Motor Cycle* owes no small degree of its world-wide popularity—remarked that a good racing car can tick over at low engine speeds quite silently in spite of an absolutely open exhaust. The exhaust of my 1912 T.T. racer Triumph, without being in any way impeded by any of the usual silencing devices, is more silent than it used to be with the standard silencer and the cut-out closed.

I will explain how this has been achieved. The left-hand end plate of the silencer box has been cut away and a 5in. extension of the same bore has been fitted to the expansion chamber. To the extension a 1⅞in. copper pipe is welded and carried to the extreme rear end of the machine. The exhaust gases have thus ample opportunity to expand and reduce their pressure, and are in consequence almost silenced.

Can any Triumph rider beat this for flexibility? I can paddle off on a 3⅔ to 1 gear, and walk beside the machine, which fires regularly at about 3 m.p.h. There are few main road hills I cannot take at 45 m.p.h., and my best speed on the level without any tuning is 58 m.p.h., all with exactly the same adjustments.

TRIUMPHALIS.



A CLEVER AND APPROPRIATE MASCOT. An exact scale model of a 75 h.p. eight-cylinder Renault airplane engine fitted to the front fork of a motor cycle owned by an Admiralty inspector.

Change of Title.

The makers of the A.B.C. motor cycle have changed the title of the company to A.B.C. Motors, Ltd.

New London Showrooms.

On and after Monday, November 22nd, Triumph motor cycles in London will be found at 218, Great Portland Street, W., instead of Holborn Viaduct.

Motor Cycle Handbooks.

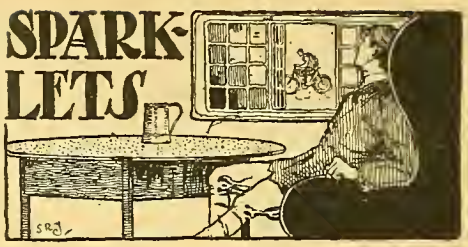
Owing to the increased postal rates the post free prices of our publishers' car and motor cycle handbooks have been slightly increased. For example "Motor Cycles and How to Manage Them" is now 1s. 4d. post free instead of 1s. 3d.

Oil for Hardening Bayonets.

Messrs. the Coro Oil and Rubber Co., of Birmingham, who manufacture oils for motor cycle engines, inform us that their products are giving great satisfaction in other directions, their hardening oil being used with great success for the hardening of bayonets.

Longuemare-Hardy Carburetters.

Messrs. Ed. J. Hardy and Co., Ltd., Queen Victoria Road, Coventry, after having been in business for thirteen years as general factors of motor accessories, have now decided to devote the whole of their time and attention to pushing the sale of the Longuemare-Hardy carburetters, Scott combined starting and lighting sets, Efandem lighting sets, Hardy patent universal joint discs, Thermoid brake lining, and copper and asbestos washers. They have, therefore, disposed of their factoring department to Messrs. Page and Kaye, who will trade under that title in premises adjoining the present ones.



A Business Change.

Mr. Sidney George, the well-known Indian racing rider and holder of the fastest speed ever done in England on a motor cycle, has severed his connection with the Hendee Manufacturing Co., Ltd.

New Beldam Tyre Works.

The Beldam Tyre Co., Ltd., of Brentford, Middlesex, have found it necessary to make considerable additions to their factory. The work was started some three months ago, and it is hoped that it will be completed very shortly.

Review.

"The Petrol Motor." F. J. Kean, B.Sc. E. and F. Spon, Ltd. 4s. The book is one which does not appeal directly to motor cyclists, but, inasmuch as it deals with the principles and working of the petrol engine, it will be of undoubted general interest. The chapter on two-stroke engines will certainly be of value to all those interested in this increasingly popular type of engine.

Catalogues Received.

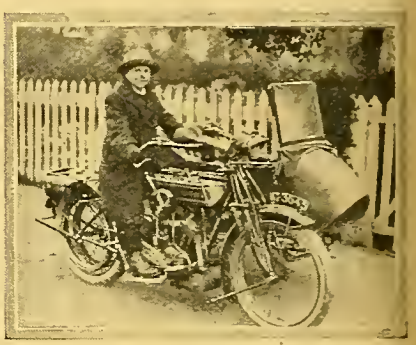
We are in receipt of a catalogue from Messrs. the Watsonian Folding Sidecar Co., Ltd., Conybere Street, Birmingham, listing all the well-known folding Watsonian sidecars suitable for machines of 2½ h.p. and upwards.

We have received a striking pamphlet from the Vacuum Oil Co., entitled "Lubrication of the Automobile: (1) The Engine." Though this does not appeal directly to motor cyclists, as the motor car engine is dealt with, the publication is of general interest. The colour drawing is particularly clear, and the whole subject is gone into very thoroughly.

We have received the latest price list of Skew motor cycle tyres from Oylers, Ltd., 35, New Cavendish Street, W. It is interesting to be able to record that Messrs. Oylers' works have been so far extended that, although they have been working night and day on Government orders, they are now able to make prompt deliveries to private motorists.

We are in receipt of a useful list of magneto parts and accessories, which has been sent us by the Runbaken Magneto Co., Ltd., Camp Street Works, Deansgate, Manchester. It lists spare parts for all types of Bosch, Eisemann, Mea, and U.H. magnetos, types for which spare parts cannot be obtained from their sources of manufacture. Spare parts are also listed of other well-known magnetos. In addition to the above, magneto spanners, magneto knives, special magneto oils, sprockets, driving chains, and platinum points are included.

The Hendee Manufacturing Co. have sent us a copy of the advance Indian catalogue. Although a more complete and fully illustrated catalogue is to be issued later, the present list contains illustrations and complete specifications of all the 1916 model Indians. In connection with the new 33⅓% import tariff, the following extract from Mr. W. H. Wells's introduction is of interest: "The burden of the import duty on such parts as we have to import we bear ourselves. We are not believers in the common expression, 'let the public pay.'"



WHEN FATHER'S OUT!

The nine-year old son of Mr. A. E. Ferris, of Green Street, near Sittingbourne, photographed at the helm of his father's 6 h.p. New Hudson sidecar outfit.

John Bull Motor Cycle Tyres.

The John Bull tyres, both Cross-Groove and Rib-stud, remain unaltered for 1916. The former is made in two qualities, the Tourist Trophy type being built upon four-ply fabric in the larger sizes, and the Standard on three-ply. The latter is made in the T.T. quality only, but is supplied in 2¾in. section (we have one of these tyres in use at present with 6,800 miles to its credit) and also in the 30in. × 3in. size.

Quite a novelty is the latest idea in patches. John Bull patches are now provided with a protective covering on the prepared surface, which is easily removable, preserves the surface, and at the same time prevents it from becoming soiled. Other articles manufactured by the Leicester Rubber Co., Ltd., are the deep-drive belts, "Unkinkable" gas tubing, overalls, and many other things useful to a motor cyclist, among which the "Oversize" horn bulb must not be forgotten.

TEN-YEAR OLD TRICAR NOW USED IN A BAKER'S DELIVERY SERVICE.

The present owner, a Toddington baker, bought the tricar—a Humber Olympia tandem—about a year ago, and substituted for the front seat the box body shown. It gives excellent service in its present form, and when one remembers that it is at least ten years old one can form a good idea of the lasting qualities of Humber material.

The Evidence Accumulates

¶ Here is further proof that "The Motor Cycle" is far and away the best medium for Miscellaneous Advertisements relating to second-hand machines, spares, fittings, etc.

So many letters are received from satisfied advertisers that it is impossible to publish them all, but a typical selection is given below.

Reasons why

THE MOTOR CYCLE

brings such

GOOD RESULTS

First.

"THE MOTOR CYCLE" has by far

The Largest Circulation

of any paper published in the interests of motor cyclists—the present figures being very considerably in excess of

80,000

copies a week.

This means that it reaches by far the greatest number of BUYERS.

Second.

The influence exerted by "THE MOTOR CYCLE" throughout the movement is far greater than that of any similar journal. It is recognised everywhere as the paper of authority.

Third.

"THE MOTOR CYCLE" contains, week by week, nearly twice as many advertisements of second-hand machines, etc., as any other paper, and buyers turn to it naturally to look for bargains.

"Delighted with the Result."

"With reference to the two motors advertised in your valuable paper a fortnight ago, I am delighted with the result. The machines were sold the next day, and I had over 20 replies, and it was impossible for me to reply to all. This is proof that 'The Motor Cycle' cannot be beaten for a sales medium."

—T. E. Dosser, Slingsby, Malton, Yorks.

"Had many offers."

"The Enfield Twin for which I put two advts. in 'The Motor Cycle' was exchanged with cash for a Zenith the next day after first advert. appeared, and I have had many offers since."

—A. V. Sandoe, 18, North Parade, Penzance.

"A splendid Advertising Paper."

"I am delighted to say that in reply to my advert. in 'The Motor Cycle' of a Lady's 1914 Douglas I received over 30 enquiries, including wires and telephone calls, in fact I did not know who to save the machine for. No doubt you will be glad to hear that 'The Motor Cycle' is such a splendid advertising paper, and personally I am delighted to give you the credit which you deserve."

—W. Brandish, Foleshill Road, Coventry.

"Quite Satisfied with the Result."

"I have pleasure in informing you that the P. & M. and Sidecar I advertised in your issue of the 16th was sold within four days. I am quite satisfied with the result of the advert."

—A. Thorpe, 55, Market Place, Leicester.

"18 Replies to date."

"You will be interested to hear that we have received to date about 18 replies to our advertisement in 'The Motor Cycle' last week of a Lightweight machine."

—The Adelaide Motor Company, 84, Chalk Farm Road, London, N.W.

"What a splendid medium."

"I thank you for forwarding on letter in reply to my ad. in 'The Motor Cycle.' This makes the 16th letter I have received, which shows what a splendid advertising medium your paper is."

—P. E. Cross, Winsham, Chard.

Send your next advertisement to "The Motor Cycle"

20, Tudor Street, London, E.C., or Coventry.

The rates for prepaid paragraph announcements are given on the first page of Miscellaneous Advertisements.

MISCELLANEOUS ADVERTISEMENTS.

PRICES.

ADVERTISEMENTS in these columns —First 12 words or less 1/6, and 3d. for every two words after. Each paragraph is charged separately. Name and address must be counted. Series discounts and special terms to regular trade advertisers will be quoted on application.

Postal Orders sent in payment for advertisements should be made payable to ILIFFE & SONS Ltd., and crossed & Co.

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Hertford Street, Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," Coventry, or London (20, Tudor St., E.C.), by the first post on Friday morning previous to the day of issue.

All letters relating to advertisements should quote the number which is printed at the end of each advertisement, and the date of the issue in which it appeared.

The proprietors are not responsible for clerical or printers' errors, although every care is taken to avoid mistakes.

NUMBERED ADDRESSES.

For the convenience of advertisers letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, the sum of 6d. to defray the cost of registration and to cover postage on replies must be added to the advertisement charge. Only the number will appear in the advertisement. Replies should be addressed, "No. 000, c/o 'The Motor Cycle,' Coventry"; or if "London" is added to the address, then to the number given, c/o "The Motor Cycle," 20, Tudor Street, E.C.

☞DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt.

The time allowed for a decision after receipt of the goods is three days, and if a sale is effected we remit the amount to the seller, but if not we return the amount to the depositor, and each party to the transaction pays carriage one way. For all transactions exceeding £10 in value, a deposit fee of 2s. 6d. is charged, when under £10 the fee is 1s. All deposit matters are dealt with at Coventry, and cheques and money orders should be made payable to Iliffe & Sons Limited.

The letter "D" at the end of an advertisement is an indication that the advertiser is willing to avail himself of the Deposit System. Other advertisers may be equally desirous, but have not advised us to that effect.

SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

DEFENCE OF THE REALM ACT

Under the provisions of the above Act, advertisers requiring workmen, and whose business consists wholly or mainly of engineering or the productions of munitions of war, or substances required for the production thereof, and whose works are situated within 30 miles of London, must include in every such advertisement the words, "No person resident more than 10 miles away, or already engaged on Government work, will be engaged."

Advertisers whose works are situated more than 30 miles from London can only have their announcements inserted with the approval of the Board of Trade, who will allocate to each advertisement a box number, and collect and distribute to the advertiser all replies received. The necessary forms of application can be obtained from any Labour Exchange or from the offices of this paper, and each advertisement must contain a clear reference to the effect that no person already engaged on Government work need apply.

Motor Cycles in 1916.

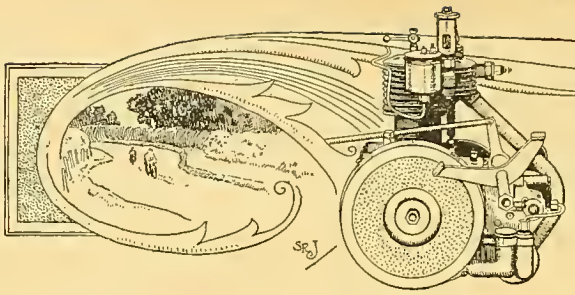
FROM the descriptions and illustrations which have appeared in these pages during the last few weeks, motor cyclists will have been able to gather the trend of design of motor cycles in 1916. Our forecast of a few weeks ago, that there would be little alteration to existing models, has proved not far short of the mark. Makers have been content this year to concentrate their attention upon improvements to detail work and the elimination of any weaknesses in design. As a result, changing for changing sake has, for once in a way, been automatically cancelled by the war, and instead the public is offered machines which have withstood at least a year's constant road usage, and upon which improvements have been effected as experience dictated. Despite the high standard to which modern designing has been brought, it may not generally be known that it is still regarded as almost a miracle if a design acts up to the expectations of the designer in every detail. Usually some modification, more or less important, is required, for when a design appears very promising on paper road experience alone can discover a weakness.

In the matter of trend of design, it is impossible to draw a definite line, for whilst the whims and idiosyncrasies of the motor cycling public differ as they do, there is bound to be a big range of machines, widely divergent in design, offered to tempt its fancies. Thus in the 1916 Buyers' Guide we have machines ranging from 1 h.p. to 9 h.p., and prices varying from £19 19s. to £94 10s. Of the 85 makes of machines described and illustrated, no fewer than 53 are of the single-cylinder variety—33 of these two-strokes—and chain and belt transmission in conjunction with the countershaft gears is adopted on 47 machines, chain drive claiming 26 adherents, and belt drive the remaining 12. Three-speed gears are standardised on no less than 38 makes of machines. Two-stroke engines are still confined to the lighter mounts, with one notable exception, and there are now unmistakable signs (as we hinted that there might be a few weeks ago) that certain troubles which seem to be inseparable from the present type of two-stroke engine are bringing the miniature four-stroke engine into the limelight again. These troubles have been ventilated in *The Motor Cycle* with a view to concentrating thought upon their eradication, so far with little success, and it is significant that quite a number of firms which have in the past confined their attention to two-stroke mounts now offer a four-stroke lightweight as an alternative. The indications at the moment are that the simple two-stroke lightweight is to be the low-priced motor bicycle of the future, whilst the four-stroke lightweight will form a class of its own and continue to gain in popularity.

Combined chain and belt transmission is still extremely popular, and many makers who adopt this form of drive are now fitting the very necessary cover for the chain. We should like to see the driving pulleys a little more equalised, in order to obtain a large gripping surface for the belt on the front pulley, so necessary with a short drive; this should be done by enlarging the front pulley rather than by diminishing the belt rim. Unfortunately, the introduction of a number of spring frame designs has been retarded by the war.

This year's Guide does not pretend to be complete, the obvious reason being that many firms are engaged in the production of munitions of war, and cannot devote any attention to motor cycles for the public. This fact is emphasised in the introduction to the Guide, and a further point for buyers to note is the fact that the prices cannot be regarded as definite for any lengthy period, in view of the state of the raw materials market. As a matter of fact, quite apart from the inflated prices, raw materials are very difficult to obtain at all, and that being so long delivery dates are quoted by manufacturers, consequently riders should order early.

An index to the advertisements in this issue will be found on the page facing the back cover.



Autumn Trips in the South.

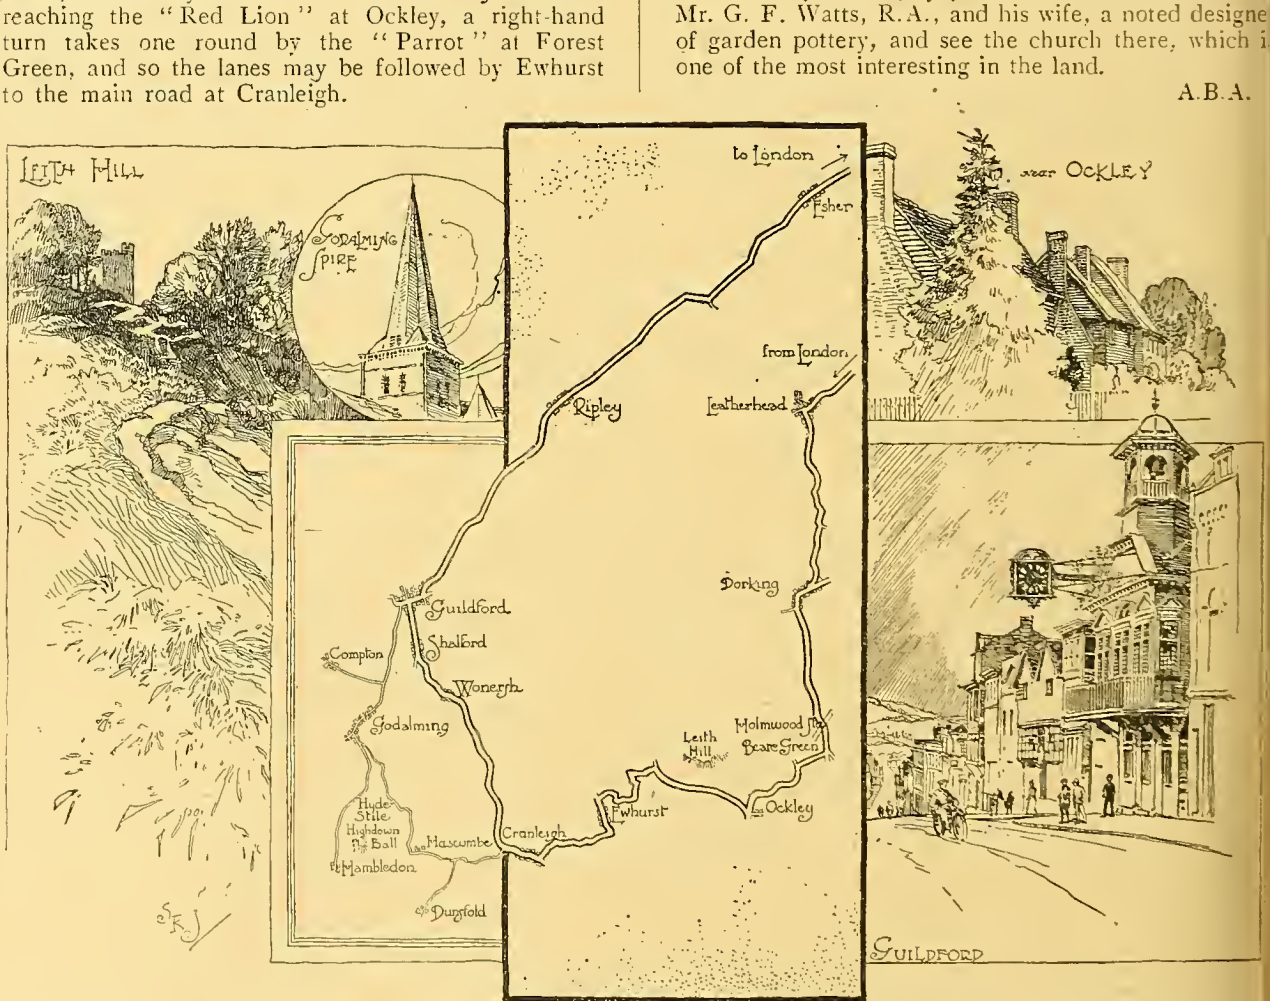
ANOTHER SUGGESTED SHORT ITINERARY FOR METROPOLITAN RIDERS.

ON October 28th we published the outline of a trip from London to Tunbridge Wells avoiding the beaten track. This was much appreciated, so the following route through the byways of Surrey will probably also be of interest to our London readers.

Travel down the Epsom Road through Leatherhead to Dorking, then turn to the right at Beare Green beyond Holmwood Station, on the Horsham Road, for Ockley on the Roman Road. Just before reaching the "Red Lion" at Ockley, a right-hand turn takes one round by the "Parrot" at Forest Green, and so the lanes may be followed by Ewhurst to the main road at Cranleigh.

Around here there are lovely little villages to see, with many high hills around, Hascombe and Hambledon especially, and Highdown Ball, that fine hill preserved by the National Trust. Arriving eventually in Guildford the rider may reach home by way of Ripley and Kingston, after a most enjoyable saunter amidst delightful lanes. If time permits the rider should make for Godalming, and pay a visit to Compton, near by, for many years the home of the artist Mr. G. F. Watts, R.A., and his wife, a noted designer of garden pottery, and see the church there, which is one of the most interesting in the land.

A.B.A.



SPARE VALVES FOR KNIGHT ENGINES.

Anent the paragraph in our last issue respecting orders for valves for two-stroke machines, we heard of a very similar case that occurred at a certain base in France where an officer of high rank was questioning A.S.C. men as to their equipment, and asked a driver if he had a spare exhaust valve complete with spring and cotter for his car. On receiving a reply "No sir," he demanded in a loud voice to know why no spare valve was carried. "Because it is a sleeve valve engine, sir," the driver meekly replied.

OCCASIONAL COMMENTS

BY 'IXION'

An American Cycle Car.

One of my colleagues has been showing round a photograph of an American cycle car, compounded out of aeroplane bits and the engine and transmission of a Harley-Davidson bicycle. It is asserted to be capable of 70 m.p.h. and is an extraordinarily attractive little vehicle to look at. Most cycle cars look spidery and flimsy, but the make-up of this little monocar satisfies the eye at any rate. Its body outlines are those of a Grand Prix racer with a very long tapered snout; but the secret of its pleasant appearance seems to rest with the wire aeroplane wheels shod with 20in. × 4in. tyres—they absolutely eliminate the faint, haunting suggestion of a buggy or perambulator which offends one in most British monocars with their high, lightly shod wheels. If I can rake a few pennies together this winter, I think I must have a try to see what I can do on similar lines. These big puddingy tyres should go far to solve the springing problems usually associated with light and speedy cycle cars.

A Two-speed Gear for Simple Machines.

It so happens that two machines of very different types now being built to my order—the one a "baby" two-stroke, the other a speed demon—both have an unusual type of two-speed gear, well adapted to any mount on which cheapness, simplicity, and absence of friction are desiderata. The drive consists in both cases of a single chain to the countershaft, on which a sliding dog couples up either of two chain and sprocket drives to the back wheel. Such a method is obviously cheaper than a gear box. It eliminates friction, in that the whole of the transmission runs on ball bearings, whilst one of the chains can be removed for speed events. The gears are easily changed, and their ratios are as easily varied by fitting different sprockets. The design seems to me preferable to that which employs two front chains and one back chain, as the slower running chains should wear less rapidly. I wonder the idea does not figure on more "baby" machines, whilst it is plainly ideal for a speed merchant's jigger.

Foreign Magnetos.

I started this season with the liveliest anticipations of magneto troubles ahead, and my apprehensions deepened when my first two 1915 magnetos—both American—promptly gave up the ghost in their first thousand miles, both of them suffering from acute internal troubles. Luckily I have had no more misfortunes, as the two American instruments which replaced them *gratis* are still sparking gaily. I am careful not to tinker with them unnecessarily, as their small screws have very poor threads. Up to date I have only struck one of the new British magnetos, a C.A.V.; it possesses the obvious solidarity of the Bosch, and has functioned quite as well. I hope the other British *débutantes* are as good. I hoped my last new cycle car would boast another Britisher, but as luck would have it the makers fitted the last survivor of their last pre-war batch of Bosch. I hope next year will bring me a varied assortment of home-made igniters, and that they will be worthy of their nationality. How are other users getting on, I wonder? I have heard very few complaints.

Single Lever Carburetters.

I have been teaching a couple of tyros to drive lately, and as usual, my main troubles arose in connection with the air lever. Neither had the pluck to straddle the four-cylinder Henderson and the 70 m.p.h. A.B.C. which I showed them, but both were cute enough to perceive that these machines possessed single lever carburetter control, and demanded why they were afflicted with twin levers? There was nothing to be said. You cannot deny that the single lever is economical, for the Claudel-Hobson, as fitted to the A.B.C. bicycle, will take a 12 cwt. car forty miles on a gallon of petrol, which is tantamount to about 120 m.p.g. on a big twin bicycle, and the Henderson, developing about 10 b.h.p., does 70 m.p.g., and accelerates like a scream on its one-lever Schebler. I could only say—knowing that I lied—that motor cyclists are mostly mechanics, and find the single lever dull. Tap twiddling is all very well so long as the motor cycle is a new toy; but when one wants it for serious locomotion, the coquettishness of the air lever is nothing more or less than a nuisance to most men. At any rate, it should be a simple matter for the carburetter makers to offer us an option; and if they do, they will find that 60% of their trade will be in the one-lever type.

Rubber-cum-steel Treads.

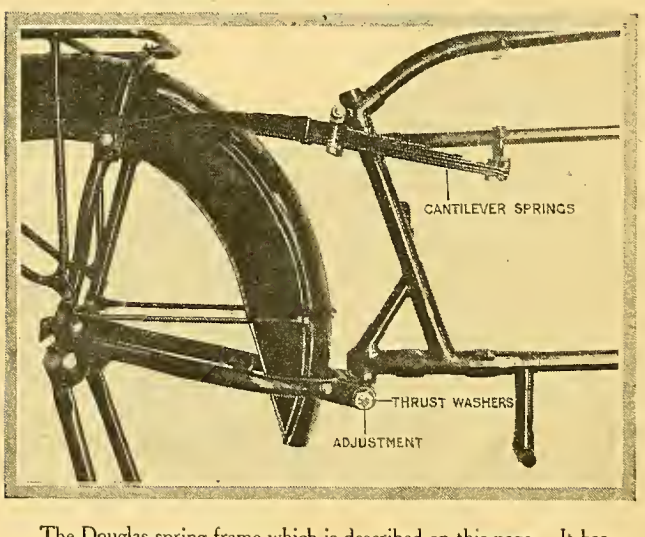
An awful week of fast work over grease in a former Scottish Trial, which is now ancient history, served to teach me that the "combination" type of tyre tread, in which rubber projections alternate with steel studs, is easily the best for solo work on genuinely virulent grease. In those days I was by no means so steady on slimy surfaces as I am now, and the speed at which the trial was run, the vile weather which accompanied it, and the delays which my machine occasioned *en route*, combined to fix the non-skidding merits of such covers indelibly in my memory. I notice that comparatively few winter riders employ these treads, but if anybody finds that the standard rubber studs do not give him adequate confidence, he can hardly do better than try a combination on the back wheel at any rate. Its value needs emphasising, because it has never really made good in the car world; the stresses of heavy vehicles result in the rubber bars wearing down or ripping off before the studs get low, and the result is a miserable caricature of the ordinary full steel-studded tread. But on motor cycles and light cars the rubber projections last much better, and as long as the tread retains any projections at all, it is a good non-skid on all manner of surfaces.

THE DOUGLAS SPRING FRAME.

A Neat Design gradually evolved after Three Years' Experiment.

THE matter of springing the rear portion of the frame is at last beginning to claim the attention of the various manufacturers, though, perhaps, more slowly in this country than in America. This is probably due to the fact that British manufacturers will not place an article on the market until they are thoroughly convinced that it is a reliable and satisfactory article. However, several British manufacturers have announced their intention of standardising a spring frame in the near future. Among these are Messrs. Douglas Bros. There is no doubt that there are hundreds of Douglas enthusiasts in England and the Overseas Dominions who will receive this announcement with joy and anxiously await the delivery dates, which unfortunately, owing to the present crisis, are likely to be very uncertain.

As far back as the year 1912 Messrs. Douglas Bros. realised that a spring frame was a necessity, and ever since have been testing to destruction a number of experimental models, out of which has been evolved



The Douglas spring frame which is described on this page. It has received a thorough testing.

the latest design. Not only has this model undergone very strenuous tests in the experimental department, but has during the last twelve months given most satisfactory results in Scotland, Canada, France, and Australia in the hands of riders unattached to the firm.

As will be seen from the illustration, the springing is carried out in a very neat and unobtrusive manner, and at the same time contains very few moving parts.

The Method of Attachment.

The back forks are pivoted about the centre of the bottom bracket, and are attached by an unusually large plain bearing. On both sides of this are fitted steel thrust bearings, which are adjustable, and by means of which the little wear that is bound to take place from time to time may be taken up. The first duty of these side thrust bearings is to prevent all lateral play in the back stays. The movement of the

Testing the spring-framed Douglas on the snow-bound roads of Canada. Mr. W. J. Tester, who is driving, has given the new Douglas a year's hard work under all conditions. His wife, seated in the sidecar, came over to England to take delivery of the outfit.

forks is in a radius, the centre of which is only just behind that of the pulley centre, so that the tension of the belt is practically unaffected by the movement.

Cantilever Laminated Springs.

The springing is obtained by means of cantilever laminated springs. The benefits derived from the adoption of this system are beyond question, for it is the method generally used and approved by the manufacturers of our most expensive and luxurious cars. These springs, as will be seen in the illustration, are clamped at their forward end firmly to a lug attached to the tank tube, while they are suspended by a bracket hung from the saddle lug. These long springs also have the advantage of assisting to prevent to a considerable extent any liability of lateral sway of the rear wheel. All the moving joints are, of course, provided with suitable methods of lubrication.

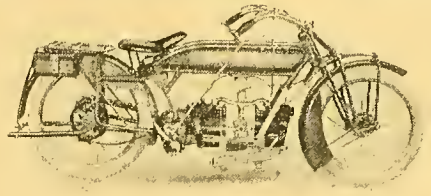
One of the new spring frame 4 h.p. Douglas outfits that has been giving Mr. A. H. Alexander, of Edinburgh, satisfaction for the past twelve months.

THE MOTOR CYCLE BUYERS' GUIDE OF 1916 MODELS

COMPLETE SPECIFICATIONS (ALPHABETICALLY ARRANGED) AND ILLUSTRATIONS OF MOTOR CYCLES ON THE BRITISH MARKET.

In the absence of a Show, "The Motor Cycle" Buyers' Guide, which has formed an annual feature of this journal since 1906, again fulfils an important mission. Naturally, great difficulties have been encountered this year in the compilation of the Guide, owing to the fact that most of the manufacturers are either wholly or partially engaged on the production of munitions of war. A number of models are unobtainable, and in preparing the Guide we have, as far as possible, in conjunction with the manufacturers, selected for illustration and description the machine which the makers are in a position to deliver. Other models produced are noted at the foot of the Specifications.

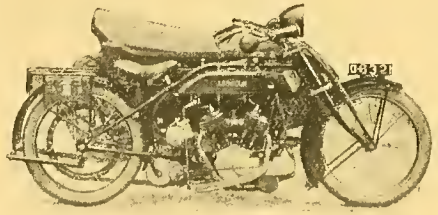
A.B.C.



3½ h.p., 2-cyl. (180°), 70×64 mm., 494 c.c., overhead exhaust valves, steel cylinders.
Dixie magneto. Claudel-Hobson carburetter.
A.B.C. 4-sp. countershaft gear, gate change. Chain.
Height 27in. Clearance 5½in. Wheelbase 57in.
Tyres, 26 × 2½in. Mechanical pump.
Petrol, 1¾ galls. Spring frame.
Price £72. Weight, 195 lb.
Other models.—Racing machine, rigid frame, weight 150 lb, same price.

A.B.C. MOTORS, LTD.,
Hersham, Walton-on-Thames.

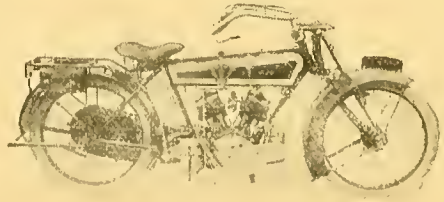
Abingdon "King Dick."



6-7 h.p., 2 cyls. (50°), 73 × 95 mm., 795 c.c., s.s.
B. & B., Amac, or Senspray carburetter.
Abingdon 3-speed countershaft gear. Chain and belt (1in.)
Height 31in. Clearance 4½in. Wheelbase 59in.
Dunlop H.S. tyres, 26 × 2½in.
Hand pump and drip feed. Petrol, 2¼ galls.
Price £83. Weight 286 lb.
Other models.—Same machine with fixed gear and belt drive, £66; 3½ h.p., 1 cyl., 499 c.c., as above, £69 6s.; with fixed gear, £53.

ABINGDON-ECCO, LTD.,
King's Road, Tyseley, Birmingham.

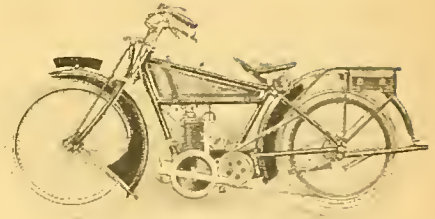
A.J.S.



6 h.p., 2-cyl., 74 × 87 mm., 748 c.c., s.s.
Splitdorf magneto. Amac carburetter.
A.J.S. 3-speed countershaft gear. Chain.
Height 30in. Clearance 4½in. Wheelbase 57in.
Avon tyres, 650 × 65 mm.
Spring-loaded hand pump. Petrol, 2½ galls.
Detachable wheels. Price, £84 Weight, 280 lb.
Other models.—2¾ h.p., 1-cyl., 349 c.c., 2 or 3-speed, £55 or £58; 4 h.p., 2-cyl., 550 c.c., 3-speed, £76.

A. J. STEVENS AND CO. (1914), LTD.
Retreat Street, Wolverhampton.

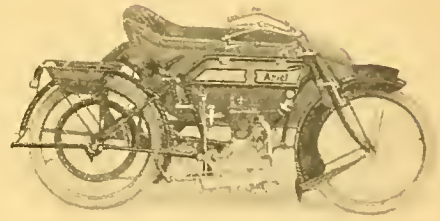
Alldays-Allon.



2¾ h.p., 1-cyl., 2-stroke, 70 × 76 mm., 292 c.c.
E.I.C. magneto. Senspray carburetter.
2-speed countershaft gear. Chain and belt.
Height 29in.
Dunlop tyres, 26 × 2¼in.
Hand pump and drip feed.
Petrol, 1½ galls.
Price £42.
Other models.—Same machine with clutch, £45; single-geared, £34; de Luxe model, £52 10s.

ALLDAYS AND ONIONS CO., LTD.,
Small Heath, Birmingham.

Ariel.



3½ h.p., 1-cyl., 86.4 × 85 mm., 498 c.c., s.s.
Splitdorf magneto. B. and B. carburetter.
Ariel 3-speed countershaft gear. Chain and belt.
Height 30in. Clearance 4¾in. Wheelbase 56in.
Dunlop tyres, 26 × 2½in. and 2¼in.
Hand pump and drip-feed.
Petrol, 1⅝ galls.
Price £64 (with sidecar, £81). Weight, 250 lb.
Other models.—2¾ h.p., 1-cyl., 2-stroke, 350 c.c., 2-speed, £44; 3½ h.p., as above, single geared, £49 10s.; 5-6 h.p., 2-cyl., 668 c.c., 3-speed, £74 10s.

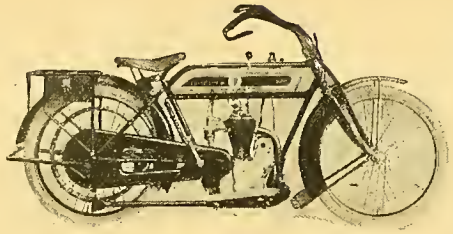
ARIEL WORKS, LTD.,
Bournbrook, Birmingham.

Bat.

5-6 h.p. J.A.P., 2-cyl. (50°), 76 × 85 mm., 770 c.c., s.s.
Bosch magneto. Amac carburetter.
Bat 3-speed countershaft gear. Chain and belt, 1in.
Height 29in. Clearance 5in. Wheelbase 54in.
Kempshall tyres, 26 × 2¼in.
Hand pump and drip feed.
Petrol, 2 galls.
Price £73. Weight, 240 lb.
Other models.—4½-5 h.p., 2-cyl., 654 c.c., £57 10s.; 7-8 h.p., 2-cyl., 976 c.c., £75.

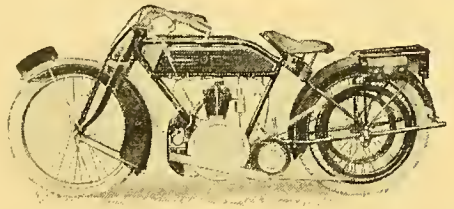
BAT MOTOR MANUFACTURING CO.,
Penge, London, S.E.

Bianchi.



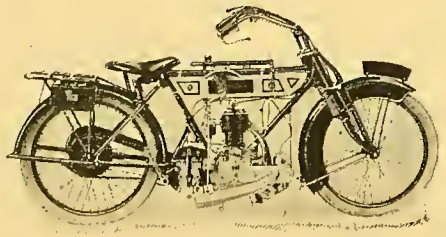
3½ h.p., 1-cyl., 75 × 112 mm., 495 c.c., s.s.
Bosch magneto. B. and B. carburetter.
Bianchi 3-speed countershaft gear. Chain.
Pirelli tyres, 26 × 2¼in.
Drip feed (Enots).
Petrol, 1½ galls.
Price £82 10s. Weight, 210 lb.
BIANCHI MOTORS, LTD.,
26, St. James's Street, London, W.

Blackburne.



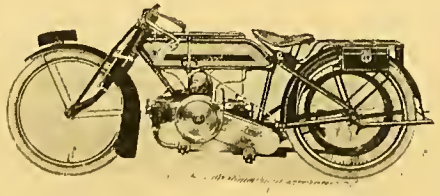
3½ h.p., 1-cyl., 85 × 88 mm., 499 c.c., s.s., outside flywheel.
Splitdorf magneto. B. and B. carburetter.
Sturmey-Archer 3-speed countershaft gear.
Chain and belt (1in.).
Height 28½in. Clearance 5in. Wheelbase 57in.
Hutchinson tyres, 26 × 2¼in.
Hand pump and drip feed.
Petrol, 2 galls.
Price £62. Weight, 212 lb.
Other model.—Same machine, single-geared, £49 10s.
BURNEY AND BLACKBURNE, LTD.,
Tongham, Surrey.

Bradbury.



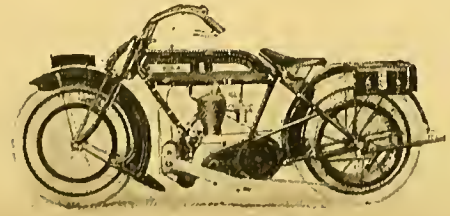
4 h.p., 1-cyl., 89 × 89 mm., 554 c.c., s.s.
Splitdorf magneto. B. and B. carburetter.
Bradbury 3-speed countershaft gear. Chain.
Height 31in. Clearance 5in. Wheelbase 53in.
Clincher, Dunlop, or Palmer tyres, 26 × 2¼in.
Hand pump and drip feed.
Petrol, 1½ galls.
Price £60. Weight 280 lb.
Other models.—Same machine, single geared, £47; 2-speed, £55; 6 h.p., 2-cyl., 749.75 c.c., 3-speed, £73 10s.
BRADBURY AND CO., LTD.,
Wellington Works, Oldham.

Brough.



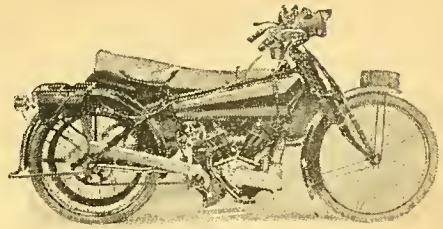
3½ h.p., 2-cyl. (180°), 70 × 64.5 mm., 497 c.c., overhead valves.
Thomson-Bennett magneto. Amac carburetter.
Brough 2-sp. countershaft gear. Chain and belt.
Height 28½in. Clearance 7in. Wheelbase 53in.
Dunlop tyres, 26 × 2¼in.
Hand pump and drip feed.
Petrol, 2 galls.
Price £63. Weight, 170 lb.
Other models.—3½ h.p., 2-cyl. (180°), 497 c.c., Sturmey-Archer 3-speed countershaft, £66 3s.; 5 h.p., 2-cyl. (180°), 685 c.c., 3-speed, £80.
W. E. BROUGH AND CO.,
Basford, Nottingham.

B.S.A.



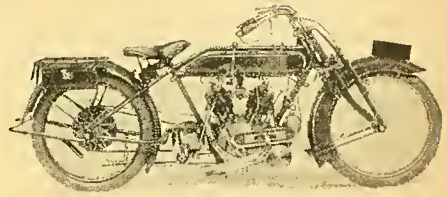
4½ h.p., 1-cyl., 85 × 98 mm., 556 c.c., s.s.
B.S.A. carburetter.
B.S.A. 3-sp. countershaft gear. Chain and belt.
Dunlop or Palmer tyres, 26 × 2¼in.
Semi-automatic sight-feed drip.
Petrol, 1¾ gals.
Price £62.
Other models.—Same machine, chain-driven, £64; 3½ h.p., 1-cyl., 499 c.c., T.T. model, single gear, £50 10s.
BIRMINGHAM SMALL ARMS CO., LTD.,
Small Heath, Birmingham.

Calthorpe.



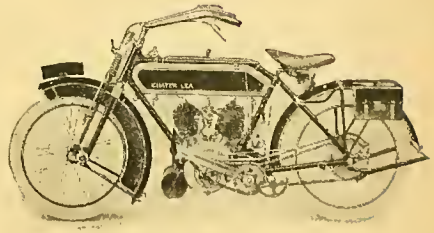
4 h.p. J.A.P., 2-cyl. (50°), 70 × 64.5 mm., 496 c.c., s.s.
Dixie magneto. Amac carburetter.
Enfield 2-sp. countershaft gear. Chain
Height 29½in. Clearance 4½in. Wheelbase 51½in.
Moseley tyres, 26 × 2¼in.
Hand pump and drip feed. Petrol, 1½ galls.
Price, with sidecar, £69. Weight, 200 lb.
Other models.—2¾ h.p., 1-cyl., 2-stroke, 245 c.c., 2-speed, £31 7s.; single geared, £27 14s. 6d.; 2½ h.p. J.A.P., 292 c.c., Enfield 2-speed, £36 15s.; single geared, £30 15s. Ladies' machines.
CALTHORPE MOTOR CYCLE CO.,
Barn Street, Birmingham.

Campion.



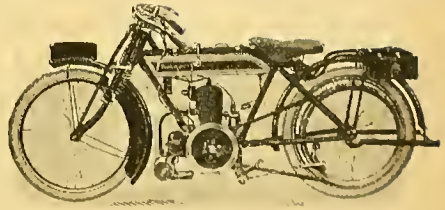
8 h.p. J.A.P., 2-cyl. (50°), 85.5 × 85 mm., 976 c.c. s.s.
Dixie magneto. B. and B. carburetter.
Jardine 4-sp. countershaft gear. Chain and belt.
Clearance 4½in.
Dunlop tyres, 650 × 65 mm.
Hand pump and drip feed. Petrol, 2 galls.
Price £82.
Other models.—4 h.p., 1-cyl., 488 c.c., Sturmey-Archer 3-speed countershaft, £67; 2½ h.p., 2-str., 269 c.c., 2-speed, £38; single geared, £31; 6 h.p., 2-cyl., 770 c.c., 4-speed, £80.
CAMPION CYCLE CO., LTD.,
Robin Hood Street, Nottingham.

Chater-Lea.



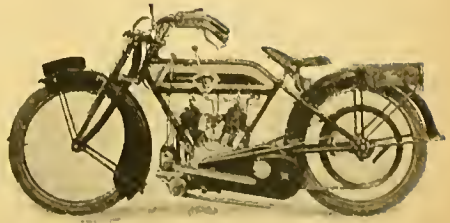
8 h.p., 2-cyl., 85 × 85 mm., 964 c.c., s.s.
B. and B. carburetter.
Chater-Lea 3-speed countershaft gear. Chain.
Clearance 5½in. Wheelbase 54in.
Tyres, 650 × 65 mm.
Drip feed. Petrol, 2 galls.
Price £82 13s. 9d. Weight, 285 lb.
Other model.—2½ h.p., 1-cyl., 2-stroke, 269 c.c. 2-speed countershaft, £38 6s. 6d.
CHATER-LEA, LTD.,
74-84, Banner Street, Golden Lane, E.C.

Connaught.



2½ h.p., 1-cyl., 2-stroke, 73 × 70 mm., 293 c.c.
E.I.C. magneto. Amac carburetter.
Single geared. Belt, ¾in.
Height 30in. Clearance 5in.
Dunlop tyres, 26 × 2in.
Petroil. Petrol, 1 gall.
Price £36 17s.
Other models.—Same machine, 2-speed countershaft, £41 16s.; with clutch, £45 2s.; miniature model, 293 c.c., £28 17s. 6d.; with 2-speed, £66 6s.
BORDESLEY ENGINEERING CO., LTD.
New Bond Street, Birmingham.

Coventry Eagle.



5-6 h.p. Abingdon, 2-cyl. (50°), 67 × 95 mm., 670 c.c., s.s.
Amac or Senspray carburetter.
Sturmey-Archer 3-speed countershaft gear.
Chain and belt, 1in.
Height 29in.
Dunlop tyres, 26 × 2¼in.
Drip feed.
Petrol, 2 galls.
Weight, 175lb.
Other models.—2½ h.p. Villiers, 1-cyl., 2-stroke 269 c.c.; 2½ h.p. J.A.P., 1-cyl., 292 c.c.; 3½ h.p. Abingdon, 1-cyl., 499 c.c.
COVENTRY EAGLE CYCLE AND MOTOR CO.,
Foleshill Road, Coventry.

De Luxe T.D.C.

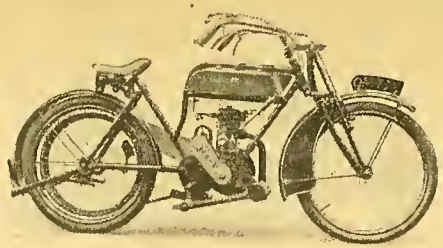
2¾ h.p. T.D.C., 1-cyl., 2-stroke, 70 × 70 mm., 269 c.c.
Dixie magneto. Amac carburetter.
Albion 2-speed countershaft gear. Chain and belt.
Height 28in. Clearance 4in. Wheelbase 50in.
Palmer tyres, 24 × 2in.
Petroil.
Petrol, 1½ galls.
Price £25 19s. Weight, 129 lb.
Other models.—Same machine with clutch, £27 5s.; single geared, £19 19s.

DE LUXE MOTOR CO.,
174, Corporation Street, Birmingham.

Despatch Rider.

2 h.p., 1-cyl., 2-stroke, 64 × 67 mm., 210 c.c.
Ericson magneto. Amac carburetter.
Single geared. Belt, ¾in.
Height 25in. Clearance 7½in. Wheelbase 46in.
Dunlop tyres, 24 × 2in.
Drip feed.
Petrol, 1¼ galls.
Price £28 7s. Weight, 89 lb.

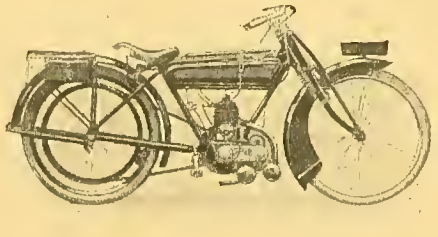
DRENG, LTD.,
Fern Road, Erdington, Birmingham.



Diamond.

2½ h.p. Villiers, 1-cyl., 2-stroke, 70 × 70 mm., 269 c.c.
E.I.C. or M.L. magneto. Amac carburetter.
2-speed countershaft gear. Chain and belt.
Height 29½in. Clearance 4½in. Wheelbase 50in.
Avon tyres, 26 × 2in.
Drip feed.
Petrol, 1¼ galls.
Price £38 17s. Weight, 120 lb.
Other models.—Same machine, single geared, £31 10s.; 2½ h.p. J.A.P., 1-cyl., 292 c.c., £40 19s.

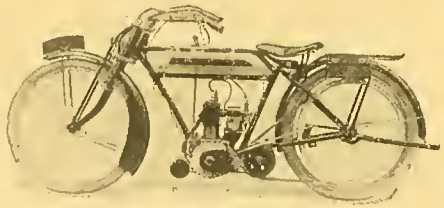
D. F. AND M. ENGINEERING CO., LTD.,
Vaae Street, Wolverhampton.



Dot.

2½ h.p. J.A.P., 1-cyl., 70 × 76 mm., 292 c.c., s.s
Dixie magneto. Amac carburetter.
Albion 2-sp. countershaft gear. Chain and belt.
Height 31in. Clearance 4½in. Wheelbase 52in.
Hutchinson tyres, 26 × 2in.
Hand pump and drip feed.
Petrol, 1¼ galls.
Weight, 134 lb.
Other models.—6 h.p. J.A.P., 2-cyl., 770 c.c., 4-speed; 8 h.p. J.A.P., 2-cyl., 976 c.c., 4-speed.

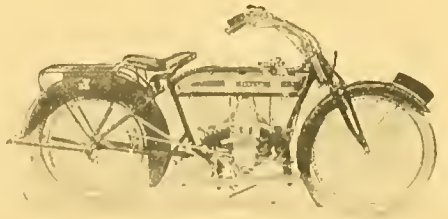
DOT MOTORS,
38, Ellesmere Street, Hulme, Manchester.



Douglas.

2¾ h.p. 2-cyl. (180°), 60.5 × 60 mm., 345 c.c., s.s.
Douglas Amac carburetter.
Douglas 3-sp. countershaft gear. Chain and belt.
Height 29in. Clearance 6½in. Wheelbase 53in.
Hutchinson tyres, 26 × 2¼in.
Hand pump and drip feed.
Price £56 14s. Weight, 175 lb.
Other models.—Same machine without clutch, £52 8s.; ditto, 2-speed, £50 8s.; 3½ h.p., 2-cyl. (180°), 592 c.c., 3-speed countershaft, £60 18s.; with sidecar, £80 17s.; Douglas spring frame, as above.

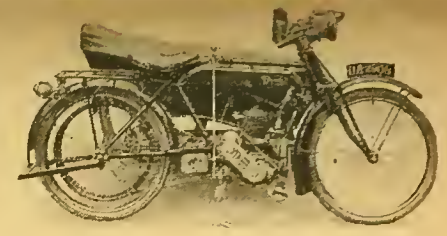
DOUGLAS BROS.,
Kingswood, Bristol.



Dunkley.

2¾ h.p. Peco, 1-cyl., 2-stroke, 75 × 79 mm., 349 c.c.
E.I.C. magneto. Amac carburetter.
2-speed countershaft gear. Chain and belt.
Hutchinson tyres, 26 × 2¼in.
Hand pump and drip feed.
Petrol, 1¼ galls.
Price £42; sidecar £10 10s. extra.
Other models.—4 h.p. J.A.P., 1-cyl., 488 c.c., 4-speed, £63; 5 h.p., 2-cyl., 654 c.c., 4-speed, £70 7s.; 6 h.p. J.A.P., 2-cyl., 770 c.c., 4-speed, £78 15s.

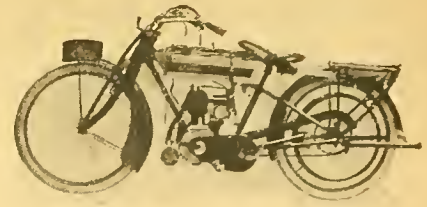
DUNKLEYS, LTD.,
Jamaica Row, Birmingham.



Edmund.

2½ h.p. J.A.P., 1-cyl., 70 × 76 mm., 292 c.c., s.r.
E.I.C. magneto. Amac carburetter.
Enfield 2-speed countershaft gear. Chain.
Height 28in. Clearance 4½in. Wheelbase 52in.
Hutchinson tyres, 26 × 2in.
Hand pump and drip feed.
Petrol, 1½ galls.
Spring frame.
Price £44 2s. Weight, 148 lb.
Other model.—Same machine with 2¾ h.p. 2-stroke Peco.

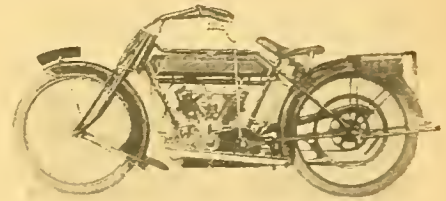
C. EDMUND AND CO.,
Crane Bank, Chester.



Enfield.

3 h.p., 2-cyl. (60°), 60 × 75 mm., 425 c.c., overhead inlets.
Thomson-Bennett magneto. Amac carburetter.
Enfield 2-speed countershaft gear. Chain.
Height 30in. Clearance 4¾in. Wheelbase 55in.
Palmer tyres, 26 × 2¼in.
Mechanical pump.
Petrol, 1½ galls.
Price £52 10s. Weight, 182 lb.
Other models.—2½ h.p., 1-cyl., 2-stroke, 225 c.c., 2-speed, £42; 6 h.p., J.A.P., 2-cyl., 770 c.c., with sidecar, £89 15s.; with Lucas dynamo set, £105.

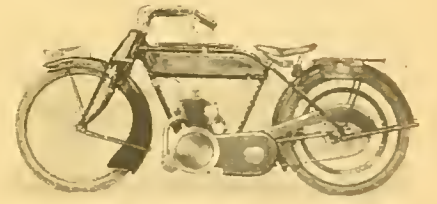
ENFIELD CYCLE CO.,
Redditch.



Excelsior.

2¾ h.p., 1 cyl., 2-stroke, 75 × 79 mm., 349 c.c.
Ericson mag. Senspray or Amac carb.
Excelsior 2-speed countershaft gear, Chain.
Height 31in. Clearance 4in. Wheelbase 53in.
Dunlop or Palmer tyres, 26 × 2¼in.
Hand pump and drip feed.
Petrol, 1 gall.
Price £44 2s. Weight 178 lb.
Other models.—2½ h.p., 1 cyl., 2-stroke, 210 c.c. £30 16s.; 3½ h.p., 1 cyl., 499 c.c., 3-speed hub, £56 14s.; 4½ h.p., 1 cyl., 650 c.c., 3-speed countershaft, £60 18s.; 5-6 h.p., 1 cyl., 800 c.c., 3-speed countershaft, £71 8s.; 8 h.p., 2 cyls., 976 c.c., 3-speed countershaft, £78 15s.

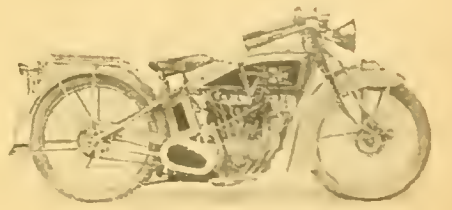
BAYLISS, THOMAS, AND CO.,
Excelsior Works, Coventry.



Excelsior (American).

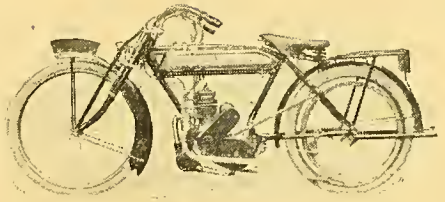
7 h.p., 2-cyl., 84 × 89 mm., 986 c.c., overhead inlets.
Bosch magneto. Schebler carburetter.
Excelsior 3-speed countershaft gear. Chain.
Height 31in. Clearance 4½in. Wheelbase 58in.
Firestone tyres, 28 × 3in.
Mechanical pump.
Petrol, 2 galls.

HARRIS AND SONS,
10, Great Chapel Street, Oxford Street, London, W.



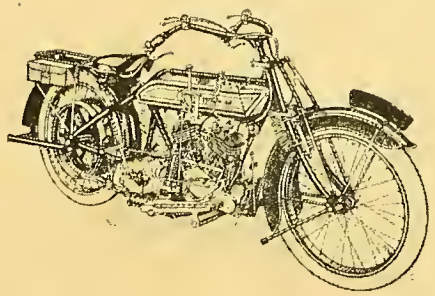
Grandex.

2¾ h.p. Precision, 1-cyl., 2-stroke, 64 × 70 mm. 225 c.c.
Splitdorf magneto. Amac carburetter.
2-speed countershaft gear. Chain and belt.
Height 28in. Clearance 5in.
Hutchinson tyres, 2½in.
Hand pump and drip feed.
Petrol, 1 gall.
Price £35. Weight, 125 lb.
Other models.—2¾ h.p., 1-cyl., 200 c.c., £30; 2¾ h.p., 1-cyl., 350 c.c., £35; 2¾ h.p., 1-cyl., 202 c.c., £35; 3¾ h.p., 1-cyl., 499 c.c., £40; 4¾ h.p., 1-cyl., 597 c.c., £60; 4 h.p., 2-cyl., 499 c.c., £60; 6 h.p. and 8 h.p., 770 c.c. and 976 c.c., £70.
GRANDEX MOTOR CYCLE CO.,
86, Gray's Inn Road, London, W.C.



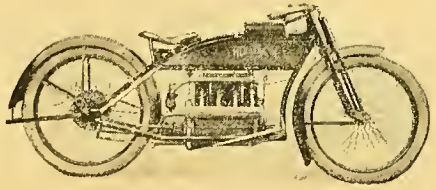
Hazlewood.

5-6 h.p. J.A.P., 2-cyl., 70 × 85 mm., 654 c.c., s.s.
Dixie magneto. B. and B. carburetter.
Countershaft gear. Chain and belt, 1in.
Height 28in. Clearance 4½in. Wheelbase 54in.
Hutchinson tyres, 650 × 65 mm.
Hand pump and drip feed.
Petrol, 1½ galls.
Price £74. Weight, 245 lb.
Other model.—4 h.p., 1-cyl., 488 c.c., £63.
HAZLEWOODS, LTD.,
West Orchard, Coventry.



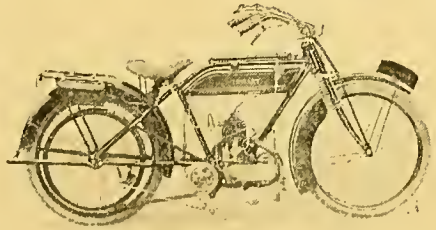
Henderson.

8 h.p., 4-cyl., 998 c.c.
Berling magneto. Schebler carburetter.
Henderson 2-speed hub gear. Chain.
Height 29½in. Clearance 5½in. Wheelbase 58in.
Tyres, 28 × 3in.
Mechanical and drip feed.
Petrol, 2½ galls.
Price £86 2s.; with sidecar, £105. Weight, 295 lb.
ROBERTSON'S MOTORS, LTD.,
157B, Great Portland Street, London, W.



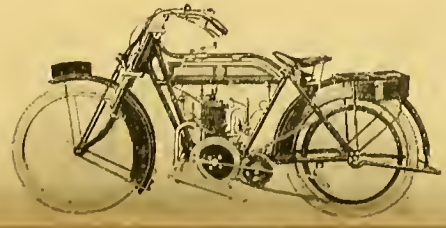
Hobart.

2½ h.p. Villiers, 1-cyl., 2-stroke, 70 × 70 mm., 269 c.c.
U.H. magneto. Amac carburetter.
Chater-Lea 2-sp. countershaft gear. Chain and belt.
Height 28in.
Dunlop or Hutchinson tyres, 26 × 2in.
Hand pump and drip feed.
Petrol, 1 gall.
Price £36 15s.
Other models.—Same machine, single geared, £30 9s.; 6 h.p., 2-cyl., 770 c.c., Sturmey-Archer 3-speed countershaft gear, with sidecar, £88 4s.
HOBART BIRD AND CO., LTD.,
St. Patrick's Road, Coventry.



Hockley.

2¾ h.p., 1-cyl., 2-stroke, 70 × 70 mm., 269 c.c.
M. and L. magneto. Senspray carburetter.
Gear to order. Belt, ¾in.
Height 30in. Clearance 5½in. Wheelbase 50in.
Dunlop tyres, 26 × 2in.
Hand pump and drip feed with three-way tap.
Petrol, 1¼ galls.
Price £32 6s. 9d. Weight, 130 lb.
HOCKLEY MOTOR MFG. CO., LTD.,
126, Barr Street, Birmingham



Indian.

7 h.p. "Powerplus," 2-cyl., 79 × 100 mm., 990 c.c., s.s.
Dixie magneto. Indian carburetter.
Indian 3-speed countershaft gear. Chain.
Height 29in. Clearance 5¾in. Wheelbase 59in.
Dunlop tyres, 28 × 3in.
Petrol, 2 galls.
Spring frame and dynamo lighting.
Mechanical pump. Price £90.
Other models.—2½ h.p., 1-cyl., 2-stroke, 215 c.c., 3-speed countershaft, £49 10s.; 5 h.p., 2-cyl., 684 c.c., 3-speed countershaft gear, £70; 7 h.p., 2-cyl., 994 c.c., 3-speed, battery lighting, £78; as above, with rigid frame and without dynamo lighting, £75.

Philipson PATENT AUTOMATIC GOVERNOR PULLEY

AS SUPPLIED TO MOTOR CYCLE SECTION OF **HIS MAJESTY'S** FORCES. ——————— GIVING

GREATER DRIVING POWER.

MORE SPEED. NO TROUBLE.

Thousands of our Governor Pulley Gears are in use at home and abroad which, according to reports of users, are giving entire satisfaction.

UNSOLICITED TESTIMONIAL.

Lincoln, March, 1915.

Messrs. Philipson & Co.

Dear Sirs,—When you first placed before the public your wonderful pulley gear I ordered one immediately from you through Messrs. Binks & Co., of Lincoln. At the end of some weeks I had the gratification of testing it, and was thoroughly satisfied with it. Since then I have become the proud possessor of medals. etc. for which I am in some way indebted to you. I have used this pulley all this time and have had practically no trouble with it.

I put up fastest time of the day at the Oakamoor Hill Climb, after which Mr. J.A.P. ordered a racing pulley from you through Messrs. Goodwin & Co., of Hanley.

In the meantime I became foolishly interested in a new type of variable gear made by another firm. This was a most unsatisfactory affair, so I put the Philipson on again and went to the makers of the other gear. They fixed their gear on in a fashion, and I returned to test same under load and against watch—**result nil.** I go into my shed and take the beast off and find I have lost the Philipson, it having worn a great hole in my portmanteau and got lost on the road.

I am writing to see if you will let me have another new racing pulley for T.T. Triumph. Please let me know exactly on what date it will arrive and I will send you cheque.

Yours truly, A.F.W.G.

Extract from "The Motor Cycle," September 30th, 1915, page 334:—

We were pleased to see that Capt. Huntbach's Premier with Philipson Pulley, which behaved so well at the United Services meeting at Brooklands on the 4th inst., made a capital ascent."

NOTE.—This was a 3½ h.p. engine competing with 7 and 8 h.p. engines.

BOWDEN WIRE LTD.

LONDON

PRATT ST. N.W.

BOWDEN WIRE MECHANISM.
The only efficient method of controlling all movements from the handle-bar. Made in various strengths and finishes.

BOWDEN CONTROLS.
Levers for use with Bowden Wire for Brakes, Clutch, Air Inlet, Magneto, and other Controls. Straight or Curved, for right or left hand and for one to three movements.

STOPS, PORTABLE CLIPS,
Etc., and all necessary fitments for use with Bowden Wire Mechanism and Controls.

BOWDEN TWO-SPEED GEAR.
A very simple and highly-efficient countershaft gear with kick-starter. Can be fitted to a number of machines without any — to most with slight—alteration. Guaranteed for engines up to 6 h.p.

BOWDEN RAPID VALVE GRINDER.
Grinds a valve quickly, and with absolute accuracy, without dismantling the cylinder. Most efficient. Also useful as a Valve Spring Lifter.

Godbolds

TAN LEATHER M.C. COSTUME.

Best Quality Tan Chrome Skins, lined camel fleece.

A magnificent costume for Winter Riding.

The coat is double-breasted and cut on smart lines. The Trouser Overalls are also lined camel fleece and have a strap at the ankle.

Price of Coat, £2 12 6
Price of Overalls, £2 2 0

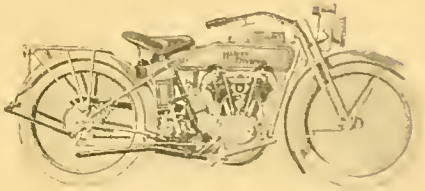
HARLEY-DAVIDSON MOTOR CO., LTD.,
Harleyson House, Newman Street, London, W.



N.B.—In connection with the prices of the 1916 models described above it may be well to throw out a warning to readers who may hereafter use this Guide for reference, that the prices quoted are those existing at this date, but cannot definitely be considered binding. This matter has been brought to our notice by more than one manufacturer, as a result of the fluctuating state of the material market. Those readers who propose placing their orders early may, of course, do so on the basis of the figures given, but should materials further increase in cost, then naturally it must be assumed that prices will be advanced in consequence. As regards delivery, several weeks of waiting are usually the rule, so that those in a position to place their orders early would be well advised to do so

NEW MODELS

· MANUFACTURERS' PROGRAMMES FOR 1916 ·

AN 8 h.p. TWIN-CYLINDER SUNBEAM.

New Three-speed Sidecar Mount in Addition to 3½ h.p. Single-cylinder.

THOUGH it has been known to a select few that Messrs. John Marston, Ltd., have had under test for some months past a powerful sidecar machine fitted with an 8 h.p. twin-cylinder M.A.G. engine of 82 × 94 mm. bore and stroke. = 992 c.c. capacity, the secret has been well kept. The machine having emerged successfully from its varied tests, and been definitely adopted as one of the Sunbeam models for 1916, we are able to illustrate it. In general design the machine follows the high standard which has characterised Sunbeam models of the past, the chief difference, as already indicated, being the adoption of the 8 h.p. twin-cylinder "V" type engine in place of the 6-7 h.p. engine used in 1915. The M.A.G. engine is so well known to our readers that it needs very little description; but it may be recalled that it has overhead valves, the mechanism being entirely enclosed and automatically lubricated.

A characteristic of this engine is the silence of its valve mechanism, its quiet running comparing very favourably with a four-cylinder car. There are but two timing wheels in this engine, three cams being formed on the single half-time wheel, one of them operating the exhaust valves and the other two the inlet valves. The engine is fed by an Amac carburetter, though a B. and B. may be supplied to order if desired. The capacity of the tank is no less than two and a half gallons.

Transmission throughout is perhaps naturally by chain in conjunction with the Sunbeam "little oil bath" chain cases, whilst the standard Sunbeam three-speed countershaft gear, in conjunction with a kick-starter, represents another fitment which has survived the test of time. One important departure from previous practice is the adoption of an internal expanding rear brake in place of the brake acting on a dummy belt rim. This brake is used in conjunction with a powerful front rim brake.

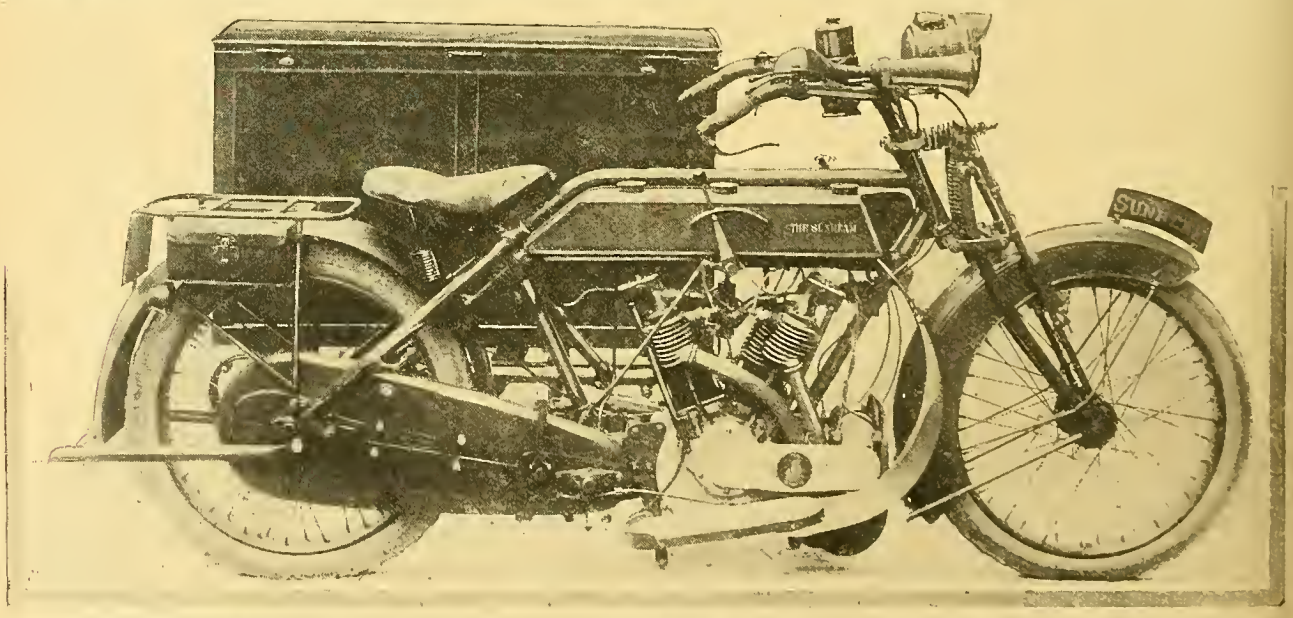
Details of the 8 h.p. Mount.

The mudguarding is excellently carried out, the valances extending the whole length of the front guard, whilst the back guard is very wide. In addition, leg shields are provided from footboards to tank tube, such as were dealt with in our article in the last issue on "Hints and Tips for Winter Riders."

The 1916 8 h.p. Sunbeam is one of the most attractive sidecar mounts on the market, for it has quickly detachable and interchangeable wheels, which are now so much sought after, whilst its design, down to the merest detail, has received very careful thought and attention, not a single flimsy part figuring in its construction. Stands for both front and rear wheels are fitted; the standard tyres are 650×65 mm. Bates or Dunlop. A ground clearance of 4½in. is provided.

The new Sunbeam is not a cheap machine—its very complete equipment could not permit of that—the price being £94 10s. With the standard sidecar fitted, the 8 h.p. Sunbeam sidecar combination retails at £119 14s.

The only other model Sunbeam for 1916 will be the 3½ h.p., which remains unaltered in design. No doubt the war has prevented the firm carrying out their intention of marketing the 4 h.p. long-stroke model, which scored such a signal success on its first appearance at the Wolverhampton Club's hill-climb at Style Cop.

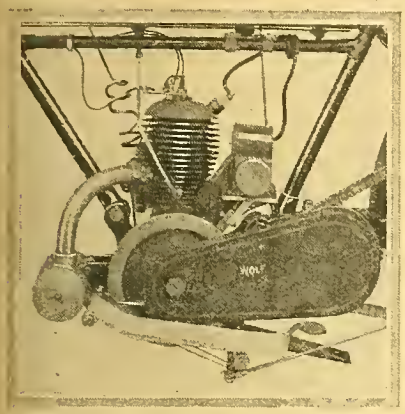


A NEW SUNBEAM—the 8 h.p. passenger machine, which follows the lines of the 6 h.p. 1915 model. A number of these new models, fitted with sidecarrier and finished in khaki, have been supplied to the Russian Government, and it is a specimen of these we illustrate.

WOLF MOTOR CYCLES IN 1916.

FOR 1916 the Wulfruna Engineering Co., Ltd., of Wolverhampton, have a range of models which should make a strong appeal to riders of all tastes. Commencing with the smallest machine, this is a 2½ h.p. two-stroke with T.D.C. engine, and, like the other single-cylinder models manufactured by the firm, may be obtained either with a single speed or countershaft gear, and also countershaft gear combined with kick-starter.

The second model two-stroke has a 2¾ h.p. Wolf engine with the same capacity as the former, viz., 70×70 mm.



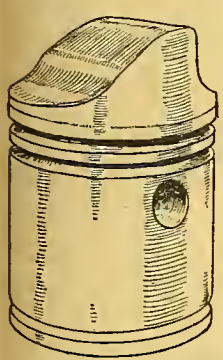
Power unit of the 2¾ h.p. two-stroke Wolf. It has a countershaft gear and the usual chain-cum-belt drive.

Two four-stroke single-cylinder Wolf machines are obtainable fitted either with a 4 h.p. J.A.P. engine or a 4 h.p. Abingdon, both with side by side valves.

A sturdy mount which should attract sidecarists is the 6 h.p. twin with a three-speed countershaft gear. This model may be obtained complete with a coachbuilt sidecar attached if desired.

1916 TWO-SPEED OMEGA.

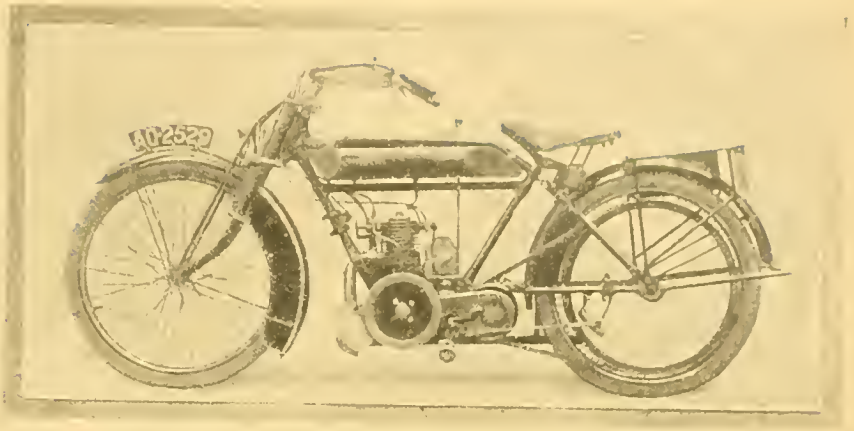
IN our issue of October 28th we gave some details of modifications to Omega machines for 1916, and since then further improvements have taken place, notably in the oiling system. Oil was formerly admitted through the inlet pipe, and it was found that a certain amount leaked at the joint of the pipe, thereby causing the engine to present a dirty appearance. On referring to the sketch it will be seen that in the new system two unions of the oil pipes are screwed to bosses on the cylinder wall. Oil entering by these means lubricates the piston and its bearings, and trickles down the cylinder, and is caught by cup-shaped projections cast on the inside of the crank case. Thence it is conducted through ducts direct to the engine-shaft bearings. These latter are thus constantly and amply lubricated so long as any oil remains in the engine, and leakage of oil is prevented by a channel leading excess lubricant back into the bottom of the crank chamber.



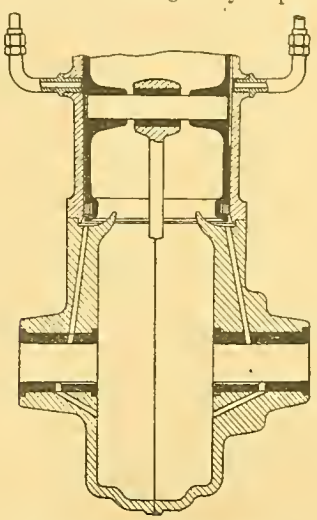
New piston of the Omega two-stroke engine. The back of the deflector has a "flat" formed on it.

Recognising that bad scavenging is responsible in a large way for loss of power, Messrs. W. J. Green, Ltd., the makers of the Omega, have gone carefully into the point, with the result that the exhaust port has been widened and the bottom of the piston head has been hollowed out to give the exhaust gases a freer escape. This modification, we are assured has made an appreciable difference to the "revving" powers of the engine.

The two-stroke Omega may be obtained with a single or two-speed gear, and the two-speed countershaft model has an aluminium cover over the chain. A further option is the fitting of a neat Watsonian sidecar attachment.



The 1916 model 3 h.p. 340 c.c. Omega two-speeder, improvements to the engine of which are described on this page.

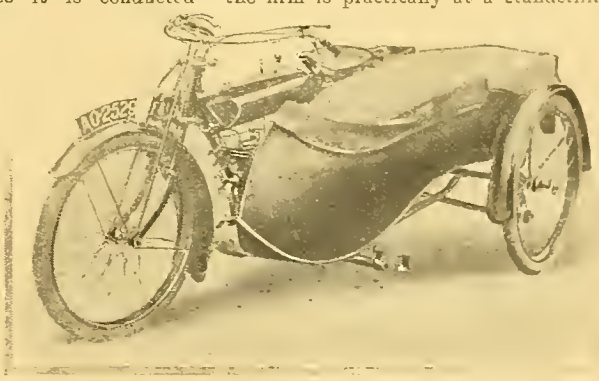


Sectional drawing showing method of lubricating piston and engine-shaft bearings of the two-stroke Omega. The piston dips into the well of oil on the bottom of the stroke.

JUNOS IN 1916.

JUNO motor cycles for 1916 will be marketed in no less than eight different types, thus catering for all requirements. The smallest is the 2½ h.p. two-stroke Juno-Villiers, of which there are four variations, from the standard fixed gear machine to the *modèle de luxe* two-speeder. At the other end of the programme is the 6 h.p. Juno-Jap with Sturmey-Archer three-speed countershaft gear.

Owing to the fact that all the employées in the motor department of the Victoria Motor and Cycle Co., Ltd., have enlisted and other men are unprocurable, the motor cycle production of the firm is practically at a standstill.



A two-stroke lightweight passenger outfit. The latest two-speed Omega with sidecar.

COVENTRY EAGLES FOR 1916.

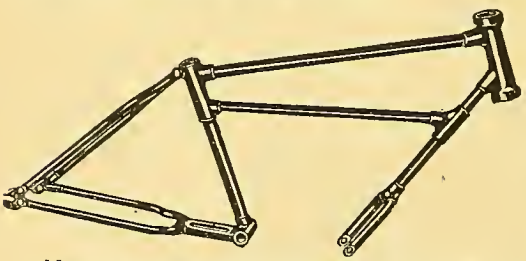
The Addition of a Four-stroke Lightweight Model.

THE models of the Coventry Eagle Cycle and Motor Co. will remain unaltered for the coming year, viz., the 5-6 h.p. twin for sidecar work, which is fitted with an Abingdon engine and chain-cum-belt transmission, the 3½ h.p. single, and a lightweight two-stroke, which is listed in both two and single-speed models.

We were interested to hear that, owing to the extravagance and many other little eccentricities of the small two-stroke type of engine, the company are also fitting the lightweight model with a single-cylinder 2½ h.p. J.A.P. engine for the coming year, making yet another model. This helps to prove the correctness of the remarks in our leader of October 14th, viz., that unless these small faults in the two-stroke were remedied, it is quite possible in the future that the lightweight four-stroke engine would eventually come into its own again, instead of being entirely ousted by the simpler two-stroke.

THE NEW TWO-STROKE HOBART.

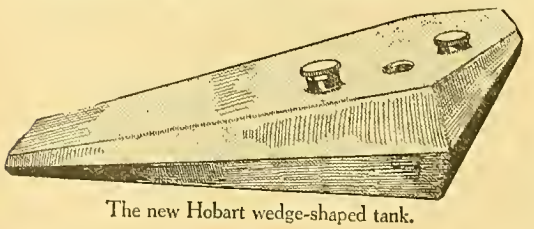
FOR the coming year the two-stroke Hobart will incorporate, in addition to several small detail improvements, an entirely new design of frame and tank. Instead of only dropping the rear portion of the top tube, the whole tube is sloped, making a straight line from the head to the upper ends of the rear stays—a design growing in favour. This not only has a neat appearance, but also increases the strength considerably. The tank, of course, is altered in shape to suit the new design, and is of the wedge-shaped variety, being wider in front than at the rear.



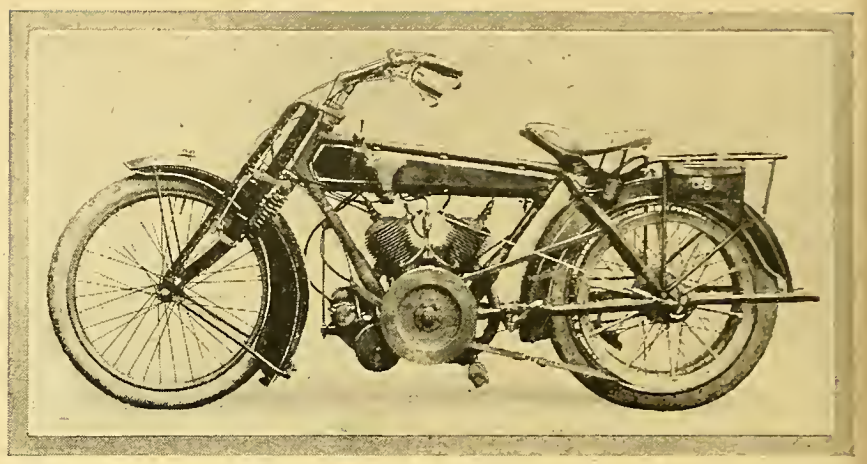
New design frame to be adopted on the 1916 model two-stroke Hobart.

An extremely low riding position is provided, the top of the saddle being less than 28in. from the ground when 26in. wheels are fitted. The engine is the Villiers, having a bore and stroke of 70 mm.=269 c.c. The Chater-Lea two-speed countershaft gear is used, this being operated from the handle-bar by a Bowden cable. The touring model has aluminium footplates, the T.T. machine having two sets of footrests. All models are fitted with Druid spring forks. Lubrication is carried out from a Best and Lloyd sight drip feed lubricator to the induction pipe; the mudguards have deep side valances and are of ample width. The new design tank will have a larger capacity than the old pattern, and will be finished like the rest of the machine in black enamel.

The Hobart lightweight has gained a fine name for quality and reliability in 1915, and its reputation promises to be enhanced next year.



The new Hobart wedge-shaped tank.



A Sun innovation—a twin-cylinder V type two-stroke, which has been under test for some months past.

SUN MODELS.

A V Type Two-stroke.

THE Sun Cycle and Fittings Co. have a range of models which appeal to all tastes, the 2½ h.p. two-stroke being the lightest and the 6 h.p. J.A.P.-engined model the heaviest mount. The lightweight may be obtained either with a Villiers or V.T.S. engine, and with a two-speed countershaft gear of the Jardine or Albion type. An excellent point of the two-speeder is the neat and efficient chain case provided for the primary drive. The fact of the flywheel of the V.T.S. being separately detachable from the shaft enables the chain casing to be fitted very neatly and efficiently, and, moreover, it is a comparatively simple matter to remove the case to shorten or replace the chain. Whether with a Villiers or V.T.S. engine, the new Thomson-Bennett lightweight magneto is used, this instrument being of very neat and compact construction and all-British.

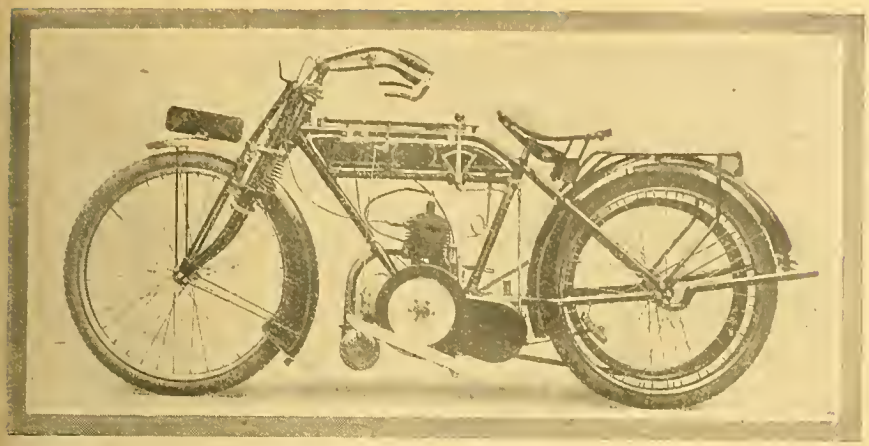
The 4 h.p. single-cylinder J.A.P.-engined model has been modernised by the adoption of a Sturmey-Archer three-speed countershaft gear, in place of the hub gear formerly used. This machine follows standard lines through out, but strikes one as being of very staunch construction and workmanlike design. The same remarks apply to the 6 h.p. twin-cylinder J.A.P.-engined model, which also has a Sturmey-Archer three speed countershaft gear. An improvement in design noticed on this model is the substitution of a powerful brake operating inside the groove of the belt pulley, which is substituted for the band brake formerly used. Aluminium footplates of substantial size are used.

Chain and belt drive is adopted as the standard transmission on all Sun machines, and the fitting on the larger models of the Sturmey-Archer countershaft gear with its operating lever connected directly to the gear unit greatly simplifies the work of adjusting the chain. This operation may be performed by simply loosening the four supporting nuts and sliding the gear along the slots provided in the bottom bracket lug on which the gear is suspended.

A V Type Two-stroke Twin.

Although the two-stroke V type twin is not by any means new, the number of different designs now undergoing experimental tests gives hope that this type will appear on the market as a capable rival to the four-stroke V engine. More especially does one hope for the success of twin two-strokes, whether V or horizontally opposed cylinder, because they are exceptionally nice to handle, smooth in running, and, having unusual "pull" at low speeds, should be equally tractable either in the thick traffic of a town or the open roads of the country.

The latest machine is the V twin Sun shown in the illustration, and, although it is of necessity an experimental machine, nevertheless our readers will admit that its lines are particularly pleasing, while the engine fits into the frame in that workmanlike manner only attained with careful design.



The 2½ h.p. two-stroke countershaft-driven Sun for 1916

The two cylinders are staggered, as the engine, although it has but one crankshaft, is otherwise composed of two "singles" joined together and having the exhaust ports so arranged that the pipes curve easily from the ports through forks in the frame to a very large silencer slung below the engine securing bracket. Thus there are no sudden corners or changes of section, and the exhausting gases have a free path of exit. It will be noticed that the rear cylinder discharges through a pipe curved almost to a semi-circle before reaching the silencer.

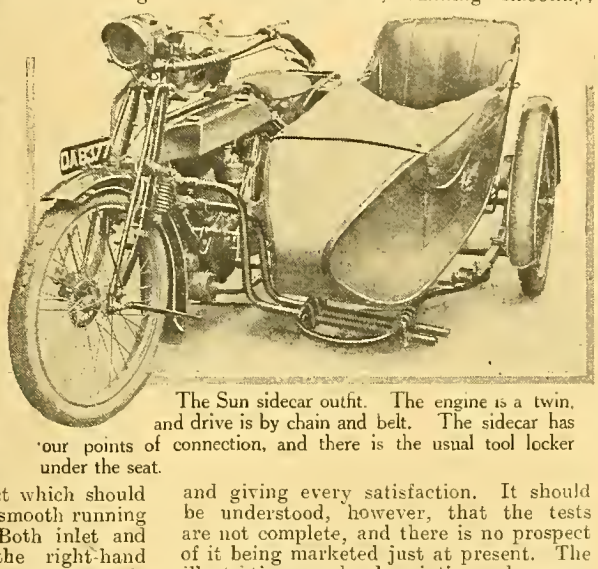
As the flywheel is external, its size is out of the common, the rim being deeper and the width greater than one is accustomed to see—a fact which should help to gain for the engine smooth running and low speed torque. Both inlet and transfer ports are on the right-hand side of the engine, being at an angle of 90° to the exhaust ports, while for experimental purposes small baffles are placed in a branch of the inlet pipe to adjust the flow of gas in each pipe from the B. and B. carburetter.

Oil is fed to a central chamber and then to the cylinder walls by the pipes seen in the illustration. Both compression releases are in the crowns of the cylinders.

As to the frame, the top tube is sloped in conformity with modern ideas, while there is a tank tube, and the head gives good space between the bearings. Both seat-pillar and down tube are forked to clear the exhaust pipes as already mentioned.

One brake acts on the front wheel rim, the other upon the belt rim well below the chain stays; this is operated by a small heel pedal of which the spindle is clipped to the bottom bracket by lugs. At present the drive is by belt with a hub gear controlled from a small lever in a quadrant bolted to the frame near the forward end of the tank.

We were informed that the road trials have proved highly satisfactory, the machine developing plenty of power with a sidecar attached, running smoothly,



The Sun sidecar outfit. The engine is a twin, and drive is by chain and belt. The sidecar has four points of connection, and there is the usual tool locker under the seat.

and giving every satisfaction. It should be understood, however, that the tests are not complete, and there is no prospect of it being marketed just at present. The illustration and description, however, show that the Sun Co. are alive to possible developments of the future.

NEW ALP TWO-STROKE.

THE Alp for 1916 will have a 2½ h.p. two-stroke engine fitted with a mechanical lubrication system, Alp magneto, and Amac carburetter. The two-speed gear is contained in an extension of the crank case, and is provided with a clutch. The Alperton Motor Co., Ltd., Alperton, Middlesex, have also adopted a spring frame, and it is hoped that the machine will be placed on the market shortly.

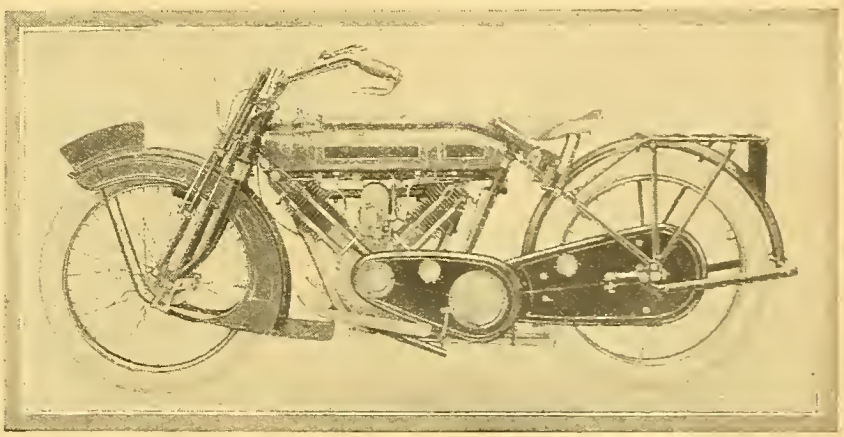
THE 1916 TORPEDOES.

MESSRS. F. HOPPER AND CO., Barton-on-Humber, have, as usual, a variety of models. There are two 2½ h.p. machines, a two-stroke of 225 c.c., and a four-stroke (292 c.c.), the latter being fitted with a two-speed countershaft gear as is also the 2¾ h.p. The larger machines have engines of 3½ h.p. and 4¼ h.p., 499 c.c. and 597 c.c. respectively, the latter being provided with a three-speed gear in the countershaft, and specially designed for sidecar work. The engines employed are Precisions.

1916 TWIN P. & M.

THE twin P. and M. is not altogether new to our readers, as it was described in detail in this journal as long ago as last November, but, owing to the demands of the R.F.C. for the 3½ h.p. model, the firm has been unable to deliver the twin to the public, and it is feared that these conditions will prevail for some time to come.

Some details of the latest twin will no doubt prove interesting. The outlines of the machine closely follow those of the famous single-cylinder. The engine is rated at 6 h.p., and has a bore and stroke of 76×85 mm., giving a cubic capacity of 770 c.c. The cylinders are placed at an angle of 90°, and, as in the case of the single-cylinder model, the front cylinder takes the place of the down tube of the frame. The magneto, which is snugly placed between the two cylinders, is driven by a shaft and bevel from the valve timing wheels. A four-speed gear is fitted. There is a kick-starter, and the drive is by entirely enclosed chains.



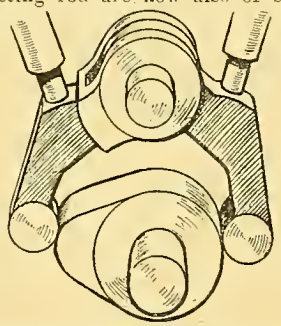
The 1916 edition of the 6 h.p. twin-cylinder (90°) P. & M. All chain drive and a four-speed gear are features of note.

Harley-Davidson Twin-cylinders for 1916.

84.1 mm. × 88.9 mm., 988.83 c.c., Chain Drive, Three Speeds, Electrical Equipment.

THE Harley-Davidson is comparatively a newcomer to these shores, but during the brief period it has been with us it has attained a well-deserved degree of popularity. It is chiefly in details that the Harley-Davidson machines have been altered.

For 1916 the engine has not undergone a great deal of alteration, the chief difference between the 1915 and 1916 models being that the valve ports are now of the streamline variety. A good deal, however, has been done in the way of improving the material used in its construction, the large inlet valves being made of nickel steel, and the springs of genuine Vanadium steel. In the case of the exhaust valves, the springs are of the same material, but the valves themselves are of tungsten steel, a material which is one of the most suitable for the purpose. Nickel steel is used for the flywheel keys, and the cages for the roller bearings of the connecting rod are now also of steel.

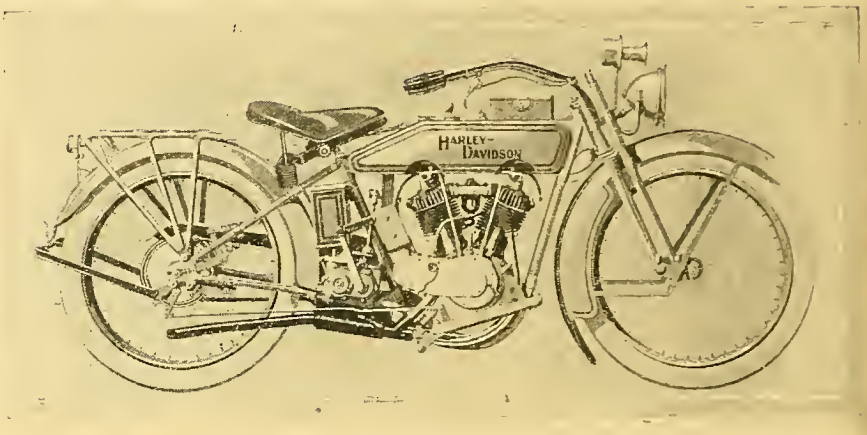


Inlet valve rocking levers. The cam is shown separately.

A new type of lubricator is fitted to the inlet valve rocker arm, and there is an oil hole in the push rod bearing on the inlet rocker arm, which makes it easy for this part to be lubricated.

The Electrical Equipment.

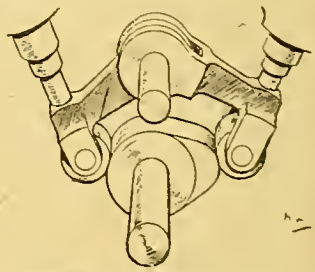
There is not very much alteration in the Remy electrical equipment, which, it may be remembered, serves to provide the current for the ignition and to charge the batteries, the chief being that a hand switch is fitted in place of the vacuum switch, as the latter was known on occasions to give a little trouble through the ingress of dirt. This year it is impossible to start the engine without turning on the ignition switch, which precludes the possibility of the driver running his generator without the battery being in circuit. In last year's model it was possible to run the generator without the battery being connected up, with the result that the voltage at high speeds was raised as high as 25, which would burn out the lamps and eventually burn out the generator. The head lamp is supplied with a bright and a dim bulb, and there is a plug in the generator casing for a sidecar lamp.



7-9 h.p. de luxe model Harley-Davidson for 1916.

An Ingenious Release Valve.

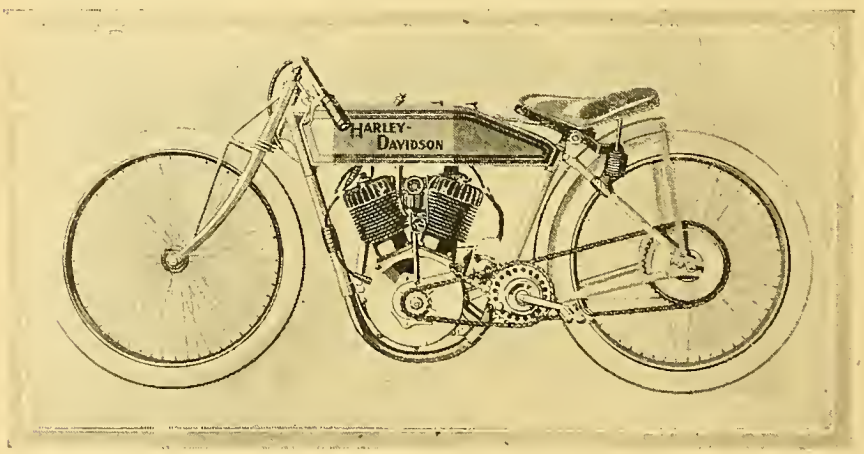
In the sketches (next page) of the timing gear the inlet rockers will be seen, and also the rollers at the end of the exhaust rockers. The great point of interest, however, in the timing gear case is the small wheel in mesh with the main pinion. This is a controlled release valve, which works in the following manner: The wheel spindle is hollow and projects right into the interior of the crank case. In it is cut a square slot which registers with a square port cut in the bearing. These two ports are made to register while the piston is descending, and remain open for practically half a revolution. This does away with all pressure in the crank case, and prevents the oil being blown through the bearings. So far it is clearly understood that the crank case pressure escapes into the timing gear case, whence the escaping oil is carried through a pipe of large diameter on to the front chain. One of the advantages of this release valve is that on account of the size of the port plenty of oil is blown through into the timing gear case, thus lubricating it adequately.



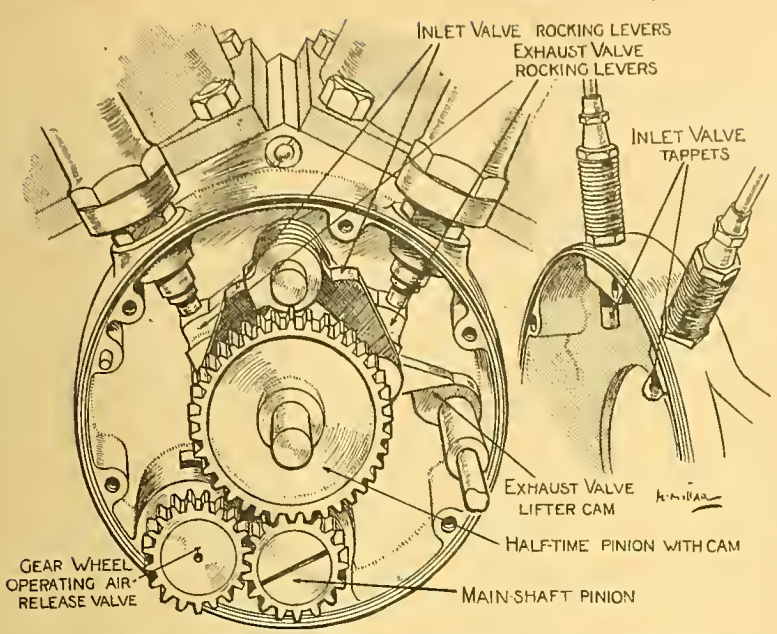
Exhaust valve rocking levers. The cam is shown separate from gear wheel to indicate operation of levers.

Three-speed Gear Box.

One of the chief innovations in the Harley-Davidson for this year is a new type kick-starter on the three-speed models, of which all the working parts are entirely enclosed, while the starter pedal folds so that if the machine is pushed over accidentally it cannot be damaged, nor injure the gear box. The starting pedal crank has been made heavier, and the leverage has been increased. A longer starter key of special steel is now fitted. The gears employed are genuine nickel chrome steel, heat treated.



Sporting edition of the 7-9 h.p. Harley-Davidson



Timing gear case with cover removed, showing timing gears, rocking levers, exhaust valve lifter, mechanically-operated release valve, and inlet valve tappets on inside of timing case cover.

As regards the gear box, the main shaft runs on special annular ball bearings, but the lay-shaft is now mounted on two Harley-Davidson roller bearings, in place of the bronze bushes formerly employed. As in the case of the engine, the rollers run in steel cages. The end thrust on the lay-shaft is taken up by ground and hardened steel thrust washers, while the shaft itself is now made heavier, and composed of chrome nickel steel. Self-aligning thrust ball bearings keep the new specially heat-treated striking rod and the clutch actuating parts in perfect alignment at all times. Special means are taken to prevent oil from leaking. The change-speed gate is made without a notch so that the lever may now be moved right through from first to second without a stop. All other parts have been specially strengthened.

Considerable improvement in the appearance of the machine has been brought about by the adoption of the new streamline tanks, the ends of which are beautifully rounded, and no seams are exposed to view. The tanks have been increased in capacity, the oil tank now holding one gallon and the petrol tank 16½ pints, while a small emergency tank holds 5½ pints, making a total of 22 pints (2¾ gallons).

We are glad to note that Messrs. Harley-Davidson have been enterprising enough to meet English tastes by incorporating larger filler caps, the new type being now 1½in. in diameter. Petrol taps are now fitted underneath the tanks, and gauze strainers are fitted inside both petrol tanks to prevent dirt reaching the carburetter.

Cycle Parts

As regards the frame, this is now made of special carbon steel tubing throughout, while nickel steel forgings are used in all important frame fittings. The head has been specially strengthened so as to render the machine still more suitable for sidecar work, and for this purpose the frame has received further strengthening in other portions. Wider front forks are now fitted, and throughout there is greater clearance for the tyres. Both mudguards have been made much wider, and the flap at the bottom of the front guard is also of greater dimensions.

The considerable improvement in the material used in the construction of the machines is due to the new Harley-Davidson process of heat treating the steel.

This, then, deals with the chief improvements in the 7-9 h.p. Harley-Davidson de luxe model. Yet another interesting machine is the 7-9 h.p. Harley-Davidson sporting model, which is single-geared, but provided with a clutch situated in the back hub. The ignition is by Bosch ignition, and rigid forks are supplied.

A NEW FOUR-STROKE DIAMOND.

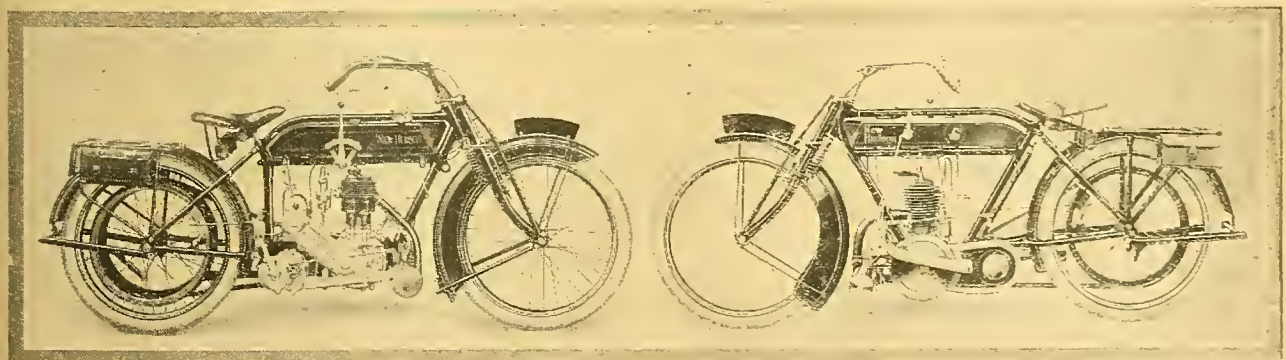
IN addition to the two-stroke Diamond lightweight which is described and illustrated in our Buyers' Guide, the makers of the Diamond will introduce for 1916 a machine fitted with a 2½ h.p. J.A.P. engine of 70×76 mm. This is a sign of the times, for we have several times thrown out hints of late that the miniature four-stroke engine would yet come into its own, in view of the difficulties connected with two-stroke engines which makers do not appear to be able entirely to overcome, even after two or three years' constant study of the question.

DETAIL IMPROVEMENTS TO NEW HUDSONS.

HARDLY any change is to be recorded in the New Hudson machines for next year, and the makers will concentrate on three models. These are the 2½ h.p. two-stroke, the 4 h.p. single-cylinder, and the 6 h.p. twin. All models have countershaft gear boxes and chain and belt drive, the lightweight having a two-speed gear and the two others three-speed gears.

The 2½ h.p. two-stroke lightweight is a sound and thoroughly tested proposition. The cylinder dimensions are 62×70 mm. (211 c.c.), the tank holds 1¼ gallons of petrol, and 24in. wheels with Dunlop tyres are standard.

The 4 h.p. single-cylinder engine (85×88 mm. = 499 c.c.) is now built into the same frame as the 6 h.p. twin model, and with its three-speed gear makes a good solo or sidecar machine. The 6 h.p. model is specially suited for sidecar work.



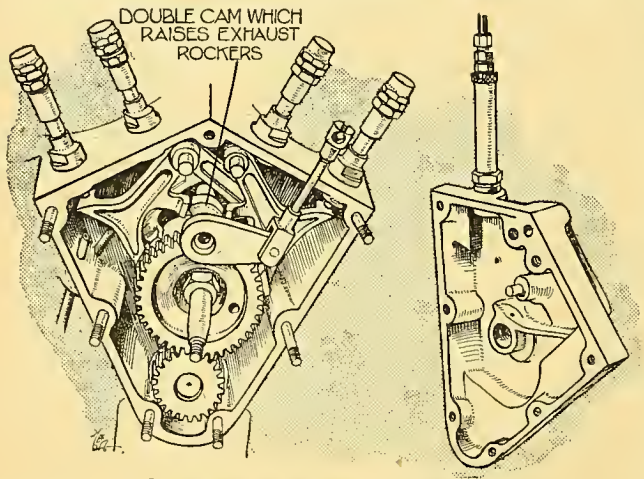
NEW HUDSON 1916 MODELS (Left) The 3½ h.p. single-cylinder and (right) the two-stroke lightweight, both chain-cum-belt driven

J.A.P. ENGINES IN 1916.

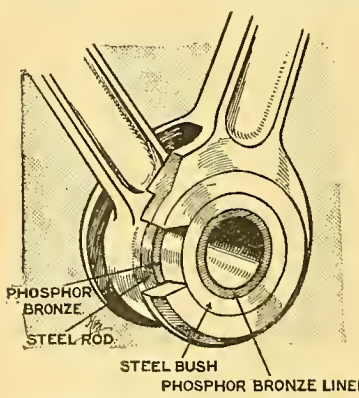
Further Details of the New Models.

IN last week's issue (p. 502) we gave a description of the new J.A.P. connecting rod, and this we are now able to illustrate. It will be remembered that a phosphor bronze bush passes through from one side of the fork rod to the other, while the centre rod works directly in the centre portion of the bush, a design which allows of a greatly increased bearing surface. The chief improvement is in the design of the bush, which is composed of steel lined with phosphor bronze. The centre rod in this case has also a phosphor bronze bush.

The latest pattern J.A.P. timing gear, the new method of lifting the exhaust valves, and the latest type of adjustable tappets are also worthy of note. The exhaust valves are raised by means of a double cam, which, when the exhaust lever is actuated, brings each cam in contact with two heels on the exhaust valve rockers, thus forcing them apart and causing the tappets to lift the valves.

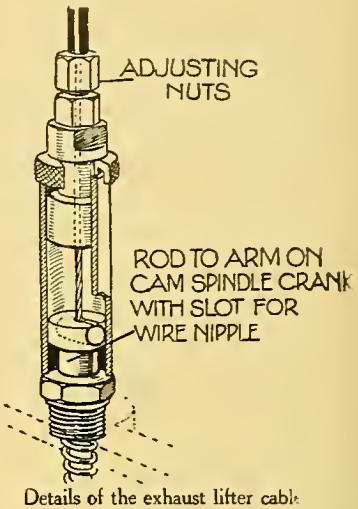


Timing gear on the latest J.A.P. engine



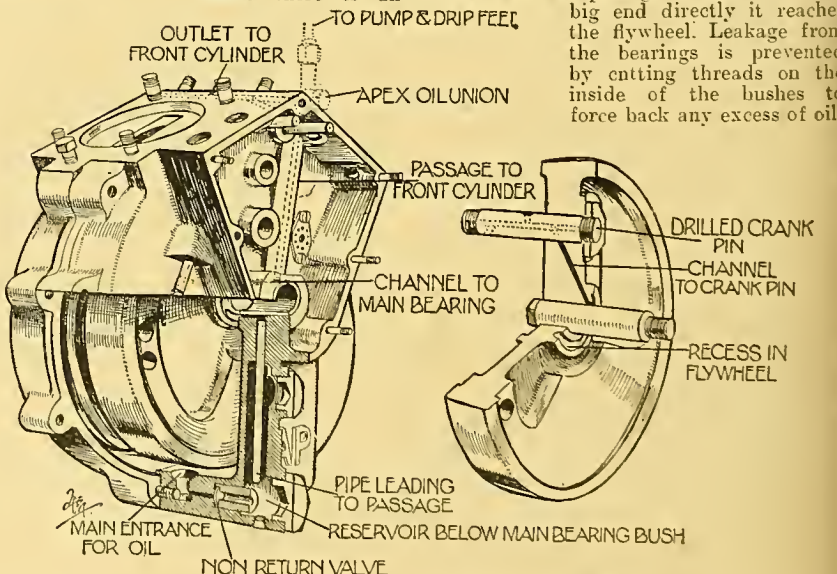
The new J.A.P. forked connecting rod, showing the arrangement of the bushes.

We now come to the interesting J.A.P. system of lubrication. The pressure system of lubrication is utilised. In this case the pressure is provided by the descending force of the piston. This forces a quantity of oil through a hole at the base of the crank chamber into a passage, and past the non-return valve into a box or reservoir cast upon the exterior of the crank case. This reservoir gives a sufficient head of oil to allow of a continuous flow. The only means of escape is a pipe through which it leaks into a recess under the main bearing bush into the flywheel, the oil being then led into a semi-circular recess on the flywheel boss, which presses tightly against the side of the crank case and registers with the oil channel, so that this recess is filled with oil under pressure, which flows through a hole in the recess through the flywheel to the centre of the crank pin, thus adequately lubricating the big end bearing. From the crank pin it descends again to the main bearing on the pulley side. Dotted lines are also shown indicating the passage of the oil from the main bearing to the hollow bolt running through the top of the crank case, where there is an outlet to the front cylinder. This bolt communicates with the apex oil union, to which the oil flows from the auxiliary pump or drip-feed into the crank chamber *via* the front cylinder; it is provided with a ball valve to prevent any blow back in the oil pipe. The non-return valve, which controls the supply from the crank case to the oiling system, is merely a flat steel disc.



Details of the exhaust lifter cable attachment.

The whole system is most ingenious, as practically the same effect is obtained as if a mechanical oil pump were employed, and yet the only additional moving part is the tiny, though absolutely reliable, non-return valve. It is also interesting to note that centrifugal force aids the passage of the oil to the big end directly it reaches the flywheel. Leakage from the bearings is prevented by cutting threads on the inside of the bushes to force back any excess of oil.



J.A.P. lubrication system

SPECIAL NOTICE.—*Copies of 'The Motor Cycle' may only be sent to neutral European countries if posted direct from the office of the publishers, or by newsagents who have obtained permission from the War Office for this purpose. The publishers of "The Motor Cycle" have obtained the necessary permission, and, consequently, can send subscribers' copies as usual. Before sending through newsagents it is important to enquire if permission has been obtained, as otherwise copies intended for neutral European countries will not be forwarded by the Post Office.*

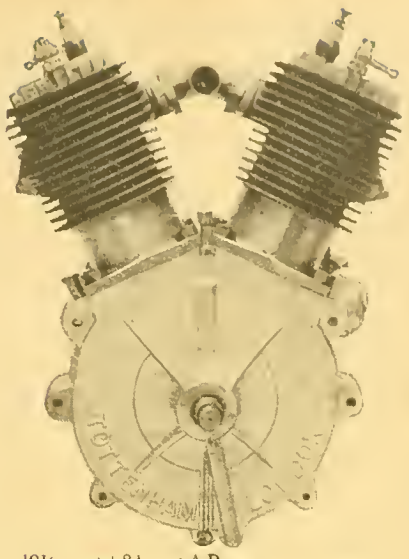
CLYNO AND GOVERNMENT REQUIREMENTS.

THERE are one or two notable absentees from the "Buyers' Guide," published in this issue. The reason is not far to seek, it being due to the fact that as such firms are solely engaged on munitions there is practically no prospect of them catering for the general public for a considerable time, unless the war ends sooner than at present appears probable.

One of these firms is the Clyno, the entire output of which is booked by the Government. As our readers know, Clyno motor cycles are used in increasingly large numbers by the War Office, their main sphere of action being in the Motor Machine Gun Section. In this and other work we have good reason to know that the Clyno is giving remarkably good results.

As has been pointed out on more than one occasion, motor traction, from the despatch rider's motor cycle to the big internal combustion engined tractor used for gun haulage, is undergoing a gigantic trial in the various theatres of war, and every motor manufacturer making war machines will benefit greatly by the lessons learnt, and the good derived therefrom will be reflected in "after the war" models.

Thus, the Clyno Co. will be in a position to put on the market a passenger motor cycle that should be an improvement on the already excellent 5-6 h.p. twin-cylinder Clyno. The manufacturers are already making their plans.



1916 model 8 h.p. J.A.P. motor cycle engine. (See previous page.)

THE ALLDAYS TWIN.

WE are informed by Messrs. Alldays and Onions that the twin-cylinder vertical engined two-stroke Allon, which we mentioned in our last issue had been on the road under test for some time, will be marketed within the next month or so. As soon as it is available for the market it will be dealt with in these pages.

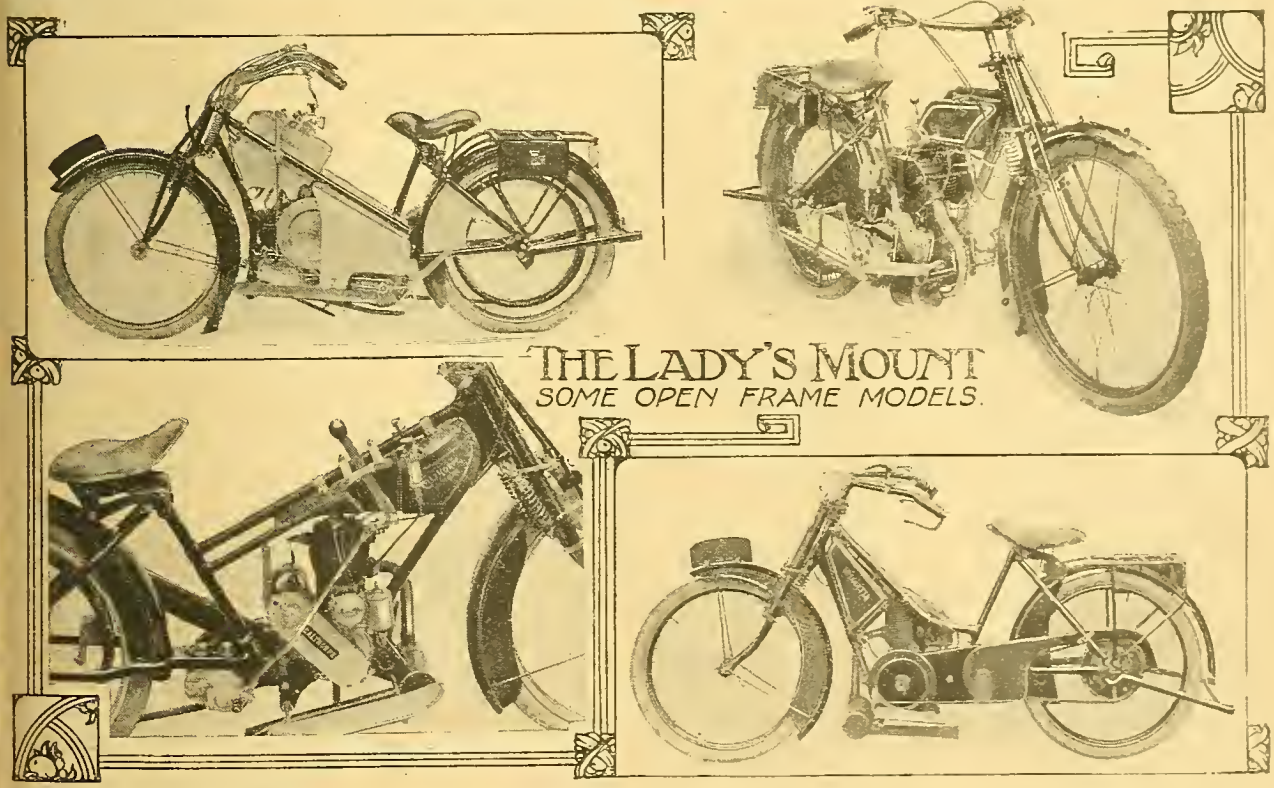
KENT LIGHTWEIGHT TOUR.

Munition Workers have a Welcome Break.

OVER a score of munition workers, mostly on two strokes, took part in the very successful two-hour forty mile tour of the Kentish hills on the 14th inst. Several competitors had been working all night at Woolwich. The two-strokes included Baby Triumphs, Allons, Clyno, Ixion, and P.V., and Scott and sidecar, and the four strokes included Douglas, J.A.P., and Enfields. A Grand Prix Morgan and a two-seater Straker-Squire joined in part of the tour. The leader, T. J. Ross, captain of the Woolwich and District M.C.C., rode a newly acquired Junior Triumph.

Owing to the bad state of Salt Box and the "new and secret hill," both were avoided, but the course included both Cudham hills, Chalk Pit, Polsteeple, and Titsey. Chalk Pit accounted for most failures. Both Junior Triumphs made clean climbs, the 8½ to 1 low gears suiting the climb. A fine climb was made by J. C. Bateman (Douglas) with a passenger on the carrier. The Scott sidecar was not apparently in tip-top condition. A rider of a 6 h.p. Enfield sidecar with two passengers climbed this and other hills. Two Matchless sidecar combinations, one steered by G. Hardee, made light work of the hills.

The return *via* Polsteeple and Cudham Church, provided some clean climbs, the two-strokes showing up well with one or two exceptions.



(Top left) The 2¾ h.p. Douglas with clutch and two-speed gear.
(Top right) Ladies' model of the 2½ h.p. New Imperial, which also has a clutch and two-speed gear.
(Lower left) Centre portion of the chain-cum-belt driven Calthorpe.
(Lower right) The Velocette has a two-stroke engine and all-chain drive.

A.C.U. Notes.

Recently Mr. T. W. Loughborough, secretary of the A.C.U., had a visit from Sergeant Self, who is vice-president of the Canadian Motor Cyclists' Association, which is affiliated to the A.C.U. Sergt. Self is attached to a Canadian contingent of the A.S.C., at present stationed in the south-east of England. The motor cycles they use are mostly Indians and Harley-Davidsons.

The Illness of Lord Ragian.

We regret to hear of the serious illness of Lord Raglan, Lieutenant-Governor of the Isle of Man. The King has appointed Mr. Thomas Kneen, Clerk of the Rolls of the Island, as Deputy-Governor during Lord Raglan's illness. Mr. Kneen has on many occasions during the Isle of Man Races acted as Deputy-Governor, and has taken the place of Lord Raglan at various functions in connection with the Tourist Trophy Races.

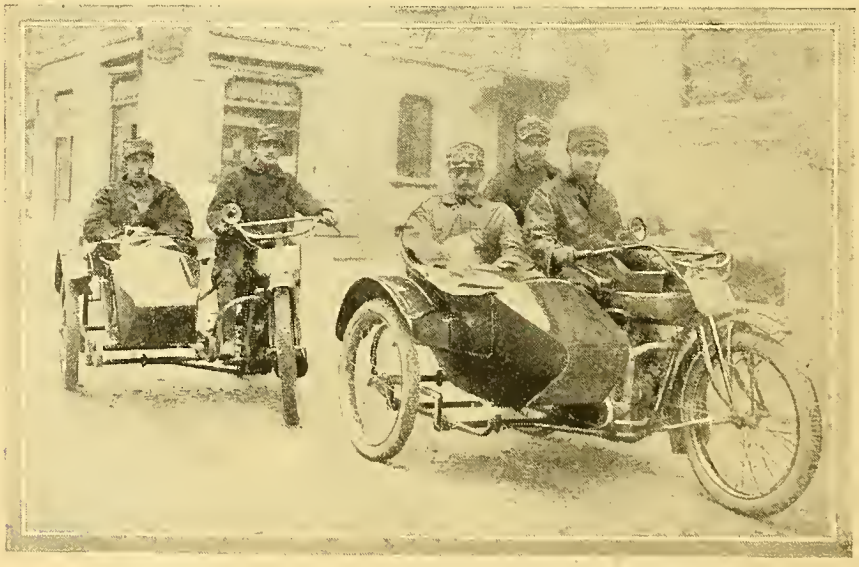
Items from Australia.

Australian motor cyclists are taking a leaf out of their English cousins' book *The Motor in Australia* says: "On English roads they are beginning to find that the 2¼in. cover does not give such good results, and is not so economical as the 2½in. How much more so, then does it apply to this country, with its inferior roads."

Quite a number of motor cyclists are considering the advisability of holding a genuine T.T. race of 220 miles in Australia, run under similar conditions to the classic event held in the I.O.M.

The Darkened Streets.

An inquest was recently held after an accident in which an unknown woman was killed by a motor omnibus. The omnibus driver said that he would have seen the woman if she had been wearing light-coloured clothing. He thought that it would be a good thing to carry a handkerchief or newspaper when crossing streets at night. Dr. Waldo, the coroner, stated he lived in a very dark road, and at night he always carried a newspaper which could be easily seen in the dark. Everyone is now wearing dark winter clothing, or else khaki, and khaki is the most difficult colour to distinguish at night.



Two of a large batch of 7-9 h.p. Indian sidecar outfits delivered to the Italian Army. The photograph was taken after the test the military authorities made before taking over the machines. They are being used mainly for the rapid transport of officers, but in some cases for carrying ammunition and general supplies. A number of solo machines of the same make for despatch riders have also been delivered.

Motor Volunteers in the North.

The Newcastle and District Motor Club has decided to take no steps with a view to the formation of a local branch of the National Motor Volunteers. This decision has been arrived at by reason of the fact that nearly 70% of the club members are at present on active service, and of the remainder a good proportion are connected with the Voluntary Aid Detachment

Analysis of the Buyers' Guide

Of the eighty-five different makes of motor cycles of which specifications and illustrations are published in *The Motor Cycle* Buyers' Guide embodied in this issue, it will be seen from the analysis published below that the most popular mount as determined by numbers is the single-cylinder two-stroke chain and belt-driven machine. The figures are very interesting to students of design, but it must be remembered that only the most popular of a firm's productions is classified :

ENGINES.	
Single-cylinder	53
Two-stroke	33
Four-stroke	20
Twins	31
V	26
Horizontal	4
Two-stroke	1
Four-cylinder	1
TRANSMISSION.	
Chain and belt	47
Chain drive	26
Belt drive	12
CHANGE-SPEED GEARS.	
Three speeds	38
Two speeds	34
Single speed	8
Variable	3
Four speeds	2

A Closed Bridge.

From December 1st motor vehicles will be prohibited from using Penwortham Old Bridge (Lancashire). A new bridge is being constructed, and will in due course be open to motor traffic.

Undignified Attacks to Cease.

In the interests of truth we feel bound to correct a misstatement which has been twice repeated in another paper in regard to our list of average prices of second-hand machines. In this, one of a series of attacks, we are accused of plagiarism, whereas the fact is that this feature appeared in our columns on January 1st, 1914—*fourteen months prior to the date* of the rival claim. This paltry incident is akin to other unsavoury attentions which we would willingly have ignored, except that they are likely to mislead. However, we observe that the contemporary in question has at last seen the error of its ways, and, after a final outburst, announces that it will cease its quibbling.

Despatch Carrying over the Pennines.

In our next issue there will appear an article from the pen of Mr. G. D. Abraham describing a despatch riding test over the "backbone of England." The ride took place when the heights were snow-covered, consequently the difficulties to be overcome were enormous, and for once the motor cyclists were forced to accept defeat. The article will be illustrated by many striking photographs. Another article, which, in view of the great interest taken in the subject at present, will be read with interest, contains an account of the advantages to be gained by the use of aluminium pistons, or, to be more exact, of pistons constructed of an aluminium alloy.

Some well-known riders who now spend part of their time testing and delivering Vickers-Clyno motor machine gun outfits. From left to right—Noakes, Freeman, Hugh Gibson, Nott, Newey, Archie Cocks, and an A.S.C. corporal.

NEW MODELS ALREADY DESCRIBED.

Many 1916 models have been described in "The Motor Cycle" during the past few weeks, and for convenience of reference we give below an alphabetical list showing the dates on which these descriptions have appeared :

Allon 2-stroke	Nov. 18, p. 494
Ariel 3-speed gear	Sept. 30, p. 316
Auto-wheel	Oct 28, p. 418
Bamford variable gear	Sept. 2, p. 227
Borgo (Italian)	Nov. 11, p. 461
Bradbury	Oct. 21, p. 402
Brough horizontal twin	Sept. 9, p. 264
" " 6 h.p.	Oct. 28, p. 419
B.S.A.	Oct. 21, p. 397

The Times Fund for the Sick and Wounded ...	2,110,163	4	2
The *Weekly Dispatch* Tobacco Fund ...	89,617	4	11
The Queen's Work for Women Fund	167,039	11	5
Daily Chronicle Xmas Gift Fund	12,659	3	0
Daily News Xmas Gift Fund	15,294	0	0

Cork Club Annual Dinner.

The annual dinner of the Cork and District Motor Cycle Club was held on Saturday evening last at the Victoria Hotel, Cork, under the chairmanship of Mr. Frank Daly, the president of the club. There was a very big attendance of the members of the club and members of the Dublin club. It was announced that the open twenty hours trial would be held in 1916 on the Whitsuntide Bank Holiday as usual. Twenty-six members of the club have joined His Majesty's Forces, all of whom, with one exception, are now serving in the field.

"THE MOTOR CYCLE" RECRUITING SECTION.

Motor Cyclist Sections Closed until Further Notice.

Some of the riders attached to the 1/57 (West Lancs Div.) Signal Coy. R.E. Reading from left to right: Corpls. W. Kerr (Douglas), T. Chorley (Triumph), F. Martin (Douglas), G. Brown (Zenith), F. Rushton (Douglas), C. W. Abbotson (Douglas), Major Oppenheim, Corpls. R. P. Scaddan (Douglas), S. Wagstaffe (B.S.A.), Artificer C. Smith (Douglas), Sergt. W. G. Clements (Douglas), and Lieut. Moant (Douglas).

RECRUITING for the Motor Machine Gun Service has had a good run, and many hundreds of readers of *The Motor Cycle*—scores of them names well known in the motor cycle world—are now doing their duty to King and country. The M.M.G.S. has proved a very popular section among motor cyclists. No doubt the fact that friends were able to enlist together and to be allotted to the same battery has been a great inducement. This arrangement was suggested to the Commanding Officer of the M.M.G.S., Lieut.-Col. R. W. Bradley, by Mr. Geoffrey Smith, Editor *The Motor Cycle*, many months ago, and was readily agreed to. Since that time many chums have come up together to the weekly examinations. Their increased value as fighters as a result of the *esprit de corps* will be obvious.

Recruiting ceased with the batch of recruits accepted yesterday (Wednesday), and no more enquiries can be dealt with until further notice.

Though there has been a steady flow of applications every morning for many months past, the influx has been greatly augmented since Lord Derby's recruiting scheme was announced. So numerous were the applications of the last fortnight that it was found impossible to accept more than a proportion of those offering their services, and naturally men of good physique and experienced motor cyclists had to be given preference.

Among the recruits accepted for the M.M.G.S. last week by Mr. Geoffrey Smith are the undermentioned:

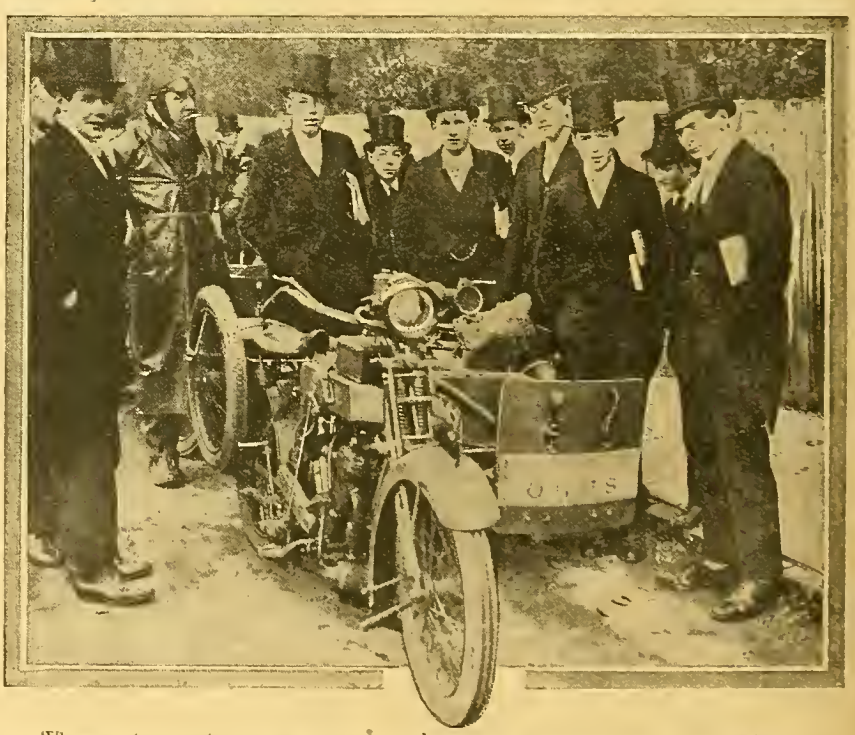
F. E. Barnes (Coventry)
A. Boswell (Coventry)
R. Brown (Dorking)
R. T. Caldecott (Birmingham)
W. Cheadle (Manchester)
R. Clarke (South Bank)
O. F. Collins (High Wycombe)
L. J. Davis (London)
H. E. Gross (Barrow-in-Furness)
R. Hall (Hertford)
A. E. Haydon (Birmingham)
J. Hill (Birmingham)
W. Hudson (Birmingham)
A. E. Hunt (Birmingham)
B. R. Hurst (Birmingham)
F. Hurst (Skipton)
J. Loving, jun. (Belper)
V. C. Newby (Bradford)
A. Nicol (Hull)
J. J. Parsons (Bedworth)
A. R. Pearce (Doncaster)
W. J. Peckham (Ringmer)
E. Read (Tunbridge Wells)
F. A. Rennison (Manchester)
C. C. Ridout (Birmingham)
J. E. Robson (Dover)
G. L. Russell (Birchfields)
R. F. Shaw (Stafford)
W. F. Steer (Sittingbourne)
W. H. Stockdale (East Grinstead)
T. D. Thomas (Llanelly)
J. Turner (Birmingham)
T. Wyatt (Fillongley)

Yesterday a further batch of fifty men were to be examined with a view to enlistment at the Coventry Recruiting Office, and those accepted will be on their way to the training centre by the time this issue is in the hands of readers.

In reply to enquiries, there are no more vacancies for officers in the M.M.G.S. at present.

We mentioned last week that recruits for the M.M.G.S. could not be accepted under the Group System, which will answer all enquiries addressed to us on this subject.

Those who have enquired for positions as motor cyclists in the Royal Flying Corps should note that recruiting in this section closed last week.



Wherever they go, the motor machine gun sidecars attract attention, and our illustration shows the interest aroused among Eton boys when a batch of new Vickers-Clyno outfits were passing through the ancient borough on their way to the M.M.G.S. training centre.

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," Hertford Street Coventry, and must be accompanied by the writer's name and address.

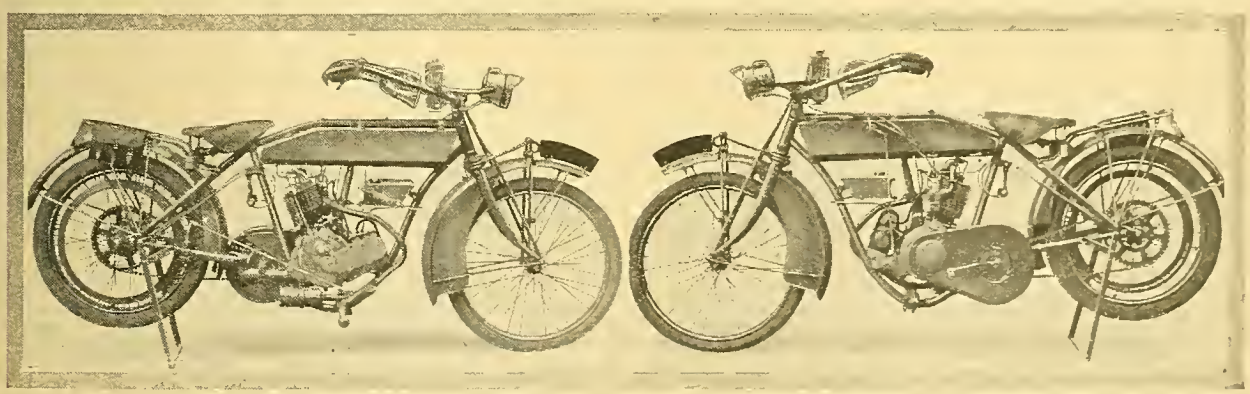
5,000 Miles with Double-seated Sidecar.

Sir,—After eighteen months' experience, during which period I have covered the distance mentioned, I claim to know something of the behaviour of this type of motor vehicle. I am sure there are many sidecar users who will be interested in my experience. When I contemplated the purchase I did not receive much encouragement from my sidecar friends, but time has upset their prejudice, and I have yet to find a sidecar driver or passenger who, after a trip with me, will not readily admit that the double-seater possesses distinct advantages over the type he favours. Of course the great advantage is that both driver and passenger are protected by hood and screen. After long journeys through rain, mud, and wind, my passenger and I arrive dry, clean, and warm. The position of a sidecar rider to the cycle driver is not my idea of comfort and sociability—the double-seater gives both. Satisfactory wheel steering, I am sure, is far and away better than handle-bar control, and I must not forget to mention the comfort of back support, specially noticeable on long journeys. As to the conduct of the engine and other working parts, I have nothing but praise. Minor troubles have been experienced, but on the road I have only had a broken inlet valve and one puncture—not so bad for 5,000 miles! The 8 h.p. air-cooled engine is "some" power unit, and, although the double-seater is rather heavy, a speed of over 40 m.p.h. is possible with a passenger. When it comes to climbing, well, Reigate on top gear, not less than 22 m.p.h. all the way up, is a specimen of what can be done. The three-speed gear box and clutch also call for praise. The chain drive has given no trouble whatever. The springing of the little car I will admit might be better, but with 700 × 80 tyres the running is not by any means uncomfortable, unless a very bad road is struck; 175 miles in eleven hours has been accomplished without fatigue. The initial outlay was not greater than that of a de luxe combination, but the running cost is perhaps a little more. When I took delivery I could not obtain more than 40 m.p.g.; now the consumption is 50, which is better than any cycle car I know. Being a three-wheeler the tax is £1. At 3,500 miles the tyre on the driving wheel was removed for retreading, and is now good for more service. The tyres on other wheels are in splendid condition. Altogether I am very well satisfied, and glad I did not go in for a motor cycle and sidecar. I am firmly convinced that the double-seated sidecar is a practical proposition, and I really wonder why a leading firm has not promoted such a vehicle. I have purposely omitted to mention the make of the machine I am driving with pleasure and satisfaction E.N.I.

An Assembled Motor Cycle.

Sir,—In reading *The Motor Cycle* I have noticed several articles and illustrations on rear springing, and I thought that it would be of some interest to you and your readers to let you know what I have done in that connection. A friend of mine who emigrated to Australia left me a 3½ h.p. Fafnir engine, a Bosch magneto, and an Indian frame with odd forks. The front and rear wheels are Chater-Lea. The spindles of these wheels were too short to bridge the frame, so I hit on the idea of making bell cranks and leaf springs, as will be seen by the accompanying illustration. This got over that difficulty, and also gave me a spring frame into the bargain. I sent the engine away and got the cylinder re-ground and a new piston fitted, and I overhauled the valves and working parts, which made it as good as new It is chain-driven, with a single gear of about 5 to 1. The double wheel on the countershaft was a find. It is cupped out on either sides, and also has a free wheel ring, which I purchased for 2s. at a second-hand shop. After getting cones and balls to fit I turned a steel spindle on which to mount them. The chain case is a wooden frame cut out of a solid piece of plane-tree with a sheet steel panel on either side which is both light and strong. The tank is home-made. I have a B. and B. carburetter with an induction pipe made out of two bends used for electric wire casing. The brake is very simple. It has a wooden shoe with an iron back which thrusts against the belt rim. It is operated by a connecting rod to the foot-rest, and is very effective. The carrier and stand are home-made. The lamp, horn, and mudguards I bought new. I have painted it the prevailing colour—khaki—and it excites great curiosity amongst motor cyclists on the road.

Seeing that I have had no experience outside of a wood-turner's shop, you will excuse me feeling a little proud of my achievement. T. PURVES, Jun.



A home-assembled machine, mainly from Indian and Fafnir parts (See letter on this page from Mr. T. Purves, Jun.)

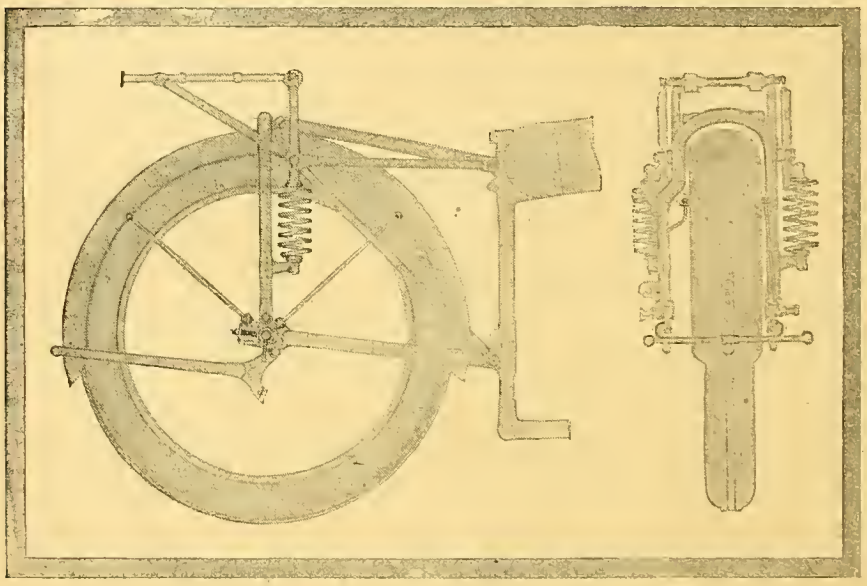
Spring Frame Design.

Sir,—Will you allow me a small space in your journal in order to answer the letter from Mr. C. H. Forbes, which appeared in your issue of the 11th inst., and which refers to "elastic" frames?

He is under the impression that only the Indian possesses a luggage carrier that is unaffected by the shocks of roads, but this is not so.

I wish to point out that in my frame the luggage carrier is independent of the wheel, and that this improvement is obtained without weakening and changing the shape generally. In my system it is only the wheel and the mudguard which move. M. VAN GEERT.

Sir,—Your correspondent last week on spring frame design is in error in stating that the luggage carrier on the Matchless design of rear spring frame is fixed to the back wheel spindle attachment. A careful examination of the illustration which appeared in *The Motor Cycle* will show that the carrier is fixed to the main part of the frame, and is, consequently, sprung.



How the Matchless carrier is sprung (see letter accompanying).

The illustration described was presumably taken from the Patent Office Records, and I might say that the present design of frame differs in detail from that shown.

H. COLLIER AND SONS, LTD.,
H. A. COLLIER, Works Manager.

Sir,—We notice in your issue of November 11th a letter from a correspondent, Mr. C. A. Forbes, dealing with spring frames in general, but the Douglas in particular. We at all times welcome criticism, but in this case we think the author should have given a little more consideration to the subject in question before seeking the publicity of the press.

Mr. Forbes admits that his information is obtained from the illustrations published in the above issue, and claims that the carriers of certain spring frames are unsprung. We are afraid your correspondent pays but a very poor compliment to the artist responsible for the drawings, and, although we have never had an opportunity of examining these frames, the illustrations leave little doubt that two of the carriers are exceptionally well sprung.

We admit that the Douglas carrier is unsprung, and it was the deliberate intention of the designer it should be so. The carrier, to our mind, is a convenience by which a certain amount of luggage may be carried, and was never intended as a passenger-carrying attachment. Otherwise we should have designed something that, although not altogether eliminating the danger of such a practice, would at least obtain for the passenger a certain amount of comfort and convenience. This, however, is but a side issue, and Mr. Forbes is privileged to retain his own opinion.

What we really object to is the paragraph in which Mr. Forbes claims that, unlike two other particular makes, the belt tension of the Douglas cannot remain constant, and endeavours to substantiate his statement by mentioning the fact that he had worked the movement out to scale. Considering that Mr. Forbes has never had access to the drawings of the Douglas spring frame, nor yet the opportunity of measuring the actual frame, we fail to see how this could be possible. It may interest Mr. Forbes to learn that the Douglas spring frame is so constructed that a 2in. movement above or below the centre line affects the chain or belt tension to the very infinitesimal extent of $\frac{1}{16}$in. Now, considering a chain requires at least $\frac{1}{4}$in. slack to run efficiently, and that dirt and grit may affect the tension more than $\frac{1}{8}$in., we fail to see how the $\frac{1}{16}$in. variation will prevent a chain, let alone a belt, from carrying out its work successfully. In this respect the Douglas frame is no worse off than the examples Mr. Forbes cites. Finally, we can assure Mr. Forbes that the Douglas is a practical frame, and has proved itself during the past two years both at home and in the Colonies, and will be included in our 1916 programme.

DOUGLAS BROTHERS.

Sir,—In the November 11th issue of *The Motor Cycle* I notice a letter by Mr. C. A. Forbes on this subject, and concur in his remarks regarding the tension of transmission on the Douglas and other spring frames of similar design. In every case where the radius fork is mounted behind the driving centre, the distance between driving and driven centres is bound to vary with the movement of back axle. This is more pronounced in some designs than in others. In the Indian machine the radius forks are mounted only about two inches behind the driving centre, and therefore the transmission tension is not seriously affected. At the same time this varying distance and transmission tension precludes the fitting of oil bath chain cases.

I would draw Mr. Forbes's attention to the fact, however, that all these difficulties have been got over in my patented system of rear springing (as illustrated in *The Motor Cycle*, October 7th). With my design there is always an equal transmission tension, whether chain or belt be used. Oil-tight cases may be fitted if desired. The carrier is sprung along with the frame, and the only unsprung weight is the back wheel and mudguard.

I have secured these advantages in my design without, as your correspondent suggests, mounting the radius fork on the countershaft driving centre (which in the case of a countershaft gear box would be a rather complicated matter, not to mention the inaccessibility of the clutch, gears, etc.). His suggestion would work all right with gears of the Enfield and P. and M. type.

E. F. DE BURGH GREENWOOD.

The Lady Motor Cyclist—A Protest.

Sir,—Just allow me to give a few words in reply to "LK 2994" and "Frankette," and I will be as brief as possible.

Surely "LK 2994" has jumped before he looked. He is entirely wrong when he says an open frame cannot be made as strong as a closed pattern, and I would particularly draw his attention to the 3½ h.p. horizontally-opposed lady's Brough, for instance. The frame of this machine is, if anything, stronger than a diamond frame: it is made throughout of straight tubing, two strong duplex tubes run down the centre forming the open frame, and the mount is thus rendered very rigid.

Accessibility, your correspondent "LK 2994" says, is reduced in a lady's mount, and here again I must contra-

dict him. Accessibility has always been an important feature in the lady's Brough, and I can remove both cylinders from my machine without taking out the engine. Surely he sees through one eye only when he speaks of "constructional difficulties," for these, to me, are something new when connected with a lady's motor cycle of to-day.

I note what "Frankette" says, and if she considers herself neat, as she says she is, whilst encased in a man's overalls and riding breeches, well, then, she should sign herself "Frank," not "Frankette."

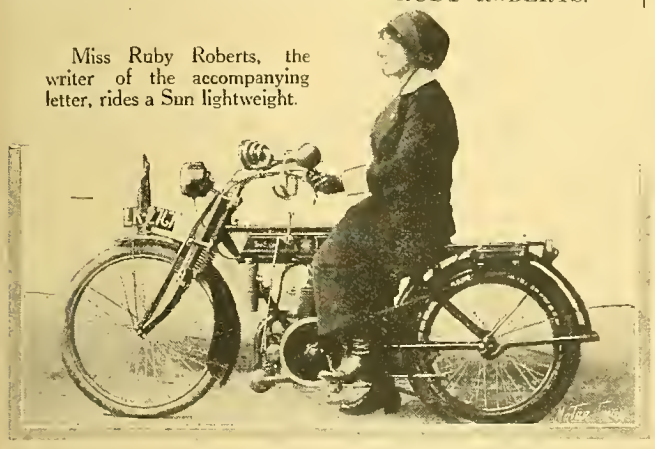
After all is said and done, I am pleased to know that my sisters of the pastime agree with me when I say that a woman encased in a man's attire is not a thing of beauty and a joy for ever.

MARY REID.

Sir,—I have read with interest during the past few weeks the articles entitled "A Protest," and if you will kindly allow me space I would like to add "my bit." I do not think our readers will say that I look "bold and mannish" when they look at my photograph. The costume which I use for motor cycling is quite an ordinary one. It is made of heavy navy cloth. The skirt is open down the front, which enables me to tuck the ends round neatly after I have mounted, which is the work of one moment, and answers my purpose admirably. When I dismount I fasten the front. My knickers are of the same material as my costume, therefore when mounting I do not "shock the public." During the past three years I have been motoring I have seen many lady motor cyclists: some have been attired in knickers and puttees, and some in men's overalls. After all, men's attire is the safest, and the women that have the pluck to wear it for motoring—well, good luck to them.

My present mount is a two-stroke lightweight Sun, which I should not wish to exchange for any open frame. It has given me every satisfaction, it is most simple to manipulate, and is very powerful and reliable.

RUBY ROBERTS.



Miss Ruby Roberts, the writer of the accompanying letter, rides a Sun lightweight.

Sir,—If you will allow me a small space of your paper, I would like to say a few words on the subject of the lady motor cyclist. I do not see that your correspondent Mary Reid should call her own sex names, when in her letter published in your paper of September 23rd she states that she must excuse the makers of her machine for not advertising their machines, as she knows they are doing their bit in making bombs to bring us back to the good old peaceful days, but yet she can call members of her own sex who are wearing breeches and doing dangerous work at the Front such names as mannish, bold, and slightly touched. I myself ride a diamond frame with much comfort, but as for looking graceful or womanish I leave that to others.

EVA LILLEY.

Paraffin as a Fuel.

Sir,—The experience of your correspondent of November 11th on the use of "Paraffin as a Fuel" closely resembles my own. I ran a 1912 Douglas a considerable distance on a mixture of paraffin and petrol in the proportion of one to two. This necessitated a large increase in the oil consumption, though even this liberal oiling did not prevent a seized big end with its train of ruin, a bent connecting rod and fractured piston, as I was at the time travelling well over the limit. Although this mishap cost me 30s., yet, reckoning this and the saving in the petrol bill and the increase in the oil bill, I saved money by the use of the heavier fuel.

Miss Eva Lilley on her New Imperial. (See letter on this page.)

For use in police infested districts a slightly greater percentage of paraffin might be used, as the opacity of the local fog in the rear of the machine is thereby greatly increased, completely obscuring the rear number plate from prying eyes. 'Ware, however, police interference for creating a nuisance, "to wit a visible vapour, evil-smelling, calculated to do grevious harm to animal life on, upon, by, or proximate to the King's highway." Smoke helmets can be obtained for a few pence or less. Wishing your paper continued success,

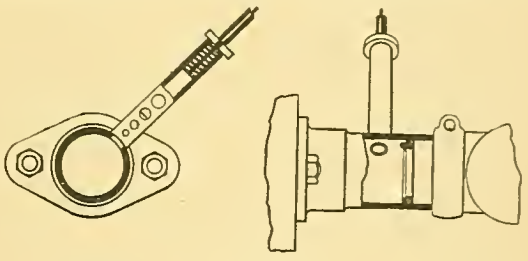
K. S. KELWAY (Corporal, R.E., 54180).

A Cure for Four-stroking.

Sir,—For a considerable time I have noticed in *The Motor Cycle* letters and enquiries from owners of two-stroke machines, who, like myself, have found that their machines have a great habit of four-stroking at slow speeds and also when going down hills, *i.e.*, when the engine has only a light load.

It may interest those who are still unable to find a remedy to know that I have quite overcome the evidently mysterious symptom.

My machine is an All-days-Allon single-gear model. I can reach a speed of forty miles per hour, and can throttle down to such an extent as to be able to get off and walk with the engine still revving; and it simply loves hills.



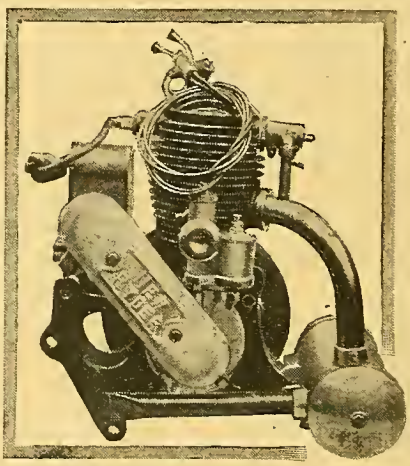
The whole secret is just this: An extra air valve, and also a non-return valve in the induction pipe. With these fitments it is possible to run down a hill with the throttle only just open, and the air valve at a position determined by trial, and engine firing on every stroke. Petrol consumption is cut down to about two-thirds the original amount; in fact, the difference these two small additions make is remarkable, and I strongly advise those who have the opportunity to do the same as I have done and try it for themselves.

R. S. CARR.

AN Open Letter to the Trade.

By B. H. DAVIES.

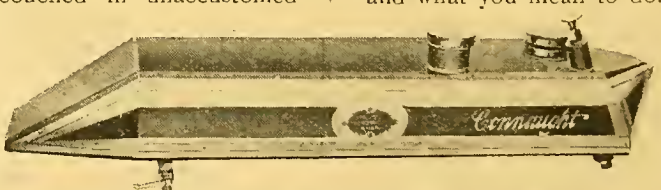
GENTLEMEN,—My epistles of previous years have usually sounded a faint note of impatience. A motor cycle manufacturer is first and foremost a trader, and in most cases he is the managing director of a limited liability company, and trades with other people's money. His primary attention must, therefore, be given to profits: and if he is already making saleable machines of a sound design, he is excusably loth to face the expense and uncertainty of evolving novel and revolutionary models. On the other hand, nobody can effect much in this vale of tears without being something of an idealist, and most of you cherish visions of the fearsome motor cycles of days to come. So there is constant war, we hope, in your bosoms—war between the commercial caution which urges you to adorn your well-tried last season model with a few trivial novelties, and the inventive originality of the keen engineer, which makes you dream dreams of a 10 h.p., 60 m.p.h., 200 m.p.g., 100 lb. four-cylinder lightweight, or some other world-shattering bantling. I have often suggested that your trading instinct is too prone to smother your inventive faculties: but at a time like this such innuendoes are silenced, and I hope that after the Peace of Berlin they would be wholly unjustified. For the present time we, the users, and you, the purveyors, are alike marking time—marking time till Joffre ceases to nibble and until the Watch on the Rhine needs a fresh mainspring. So my letter to you this year will be couched in unaccustomed accents, as befits unaccustomed times.



Power unit of the 1916 model two-stroke New Ryder. The cylinder dimensions are 70 mm. × 70 mm. (269 c.c.)

The Industry's Part in the War.

And first I join heartily with your innumerable clients, whether at home, in Flanders, in Gallipoli, in Serbia, in congratulating you on the magnificent manner in which you have organised yourselves, your staffs, your works, and your brains unreservedly at the service of the nation. You are making almost anything and everything in the world except motor cycles: the few thousand machines with which you provide the despatch riding and machine gun services are a drop in the ocean compared to the shells, fuses, searchlights, hand grenades, guns, aeroplane parts, and other munitions, destined—we hope shortly—to hunt the Hun back into his Fatherland. You have had to plan and scheme largely as men groping in a fog. You seldom knew whether the completion of a contract spelt the closing of your works, or the receipt of a second contract ten times as big. You had to frame quotations in abysmal ignorance about your chances of securing raw materials, or of the prices you would be charged for them. You have lost the cream of your skilled men, and you have had to improvise fresh staffs out of their wives, sweethearts, and daughters—aye, and even out of their fathers and grandfathers. You have had to control a—mercifully small—percentage of men temporarily demoralised by inflated pay sheets, and to employ a few hands whom you never expected to see inside a decent factory again. Many of these factors contain the seeds of possible labour troubles in days to come. But, all credit to you and to those who have flocked into your employment, the industry has emerged from all these ordeals, and to-day it is among the most formidable in an iron ring of menacing organisations, which is daily being welded tighter and tighter round the heart of the Central Powers. We, who have often sneered and cavilled and grumbled about some of your petty shortcomings, are lost in honest, British admiration at what you have done, what you are doing, and what you mean to do.



Attractive tank as fitted to the 1916 model two-stroke Connaught.

Nevertheless, though you are Government munition makers for the nonce, you have not forgotten your first love, nor have we. When we speak of peace, we remember, not first, nor second, but we remember still, the call of the road. So do you, and ere long you will help us again to respond to that call. Let us pretend, for a moment, that the Allies entered Berlin in triumph yesterday, and weave our fancies about the summer's riding that lies ahead.

Our roads were bad before poor William went crazy, and they have hardly been touched in the way of repair ever since. Ceaseless streams of W.D.

Norton

Ideal for Present Conditions.

YOU

cannot do better than select a Norton, whether you require a machine for solo-riding or as a passenger vehicle.

The T.T. Model illustrated has a small engine —only 3½ h.p. 490 c.c.— (which means Economy) yet it forms an ideal combination if used with our light model sidecar.

Remember also this machine holds the sidecar record for Brooklands Hill, the 50 miles Championship of Ireland, and many other honours.

Here's your Lucky Mascot!

THE WONDERFUL WOLF

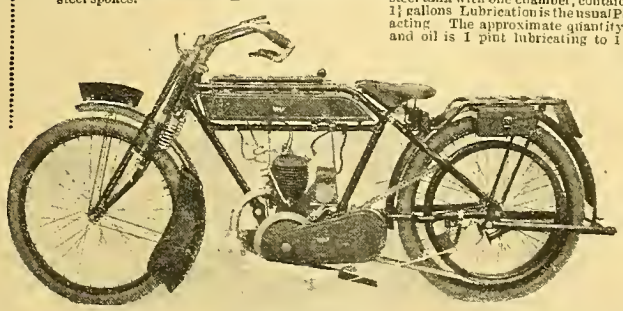
Pioneer of the Cheapest and Best of all Motorcycles.

See that the "WOLF" trade mark appears on the tank of your new Motorcycle, and you will be certain to obtain a machine of proved reliability and wonderful value. There is a splendid range of "Wolf" models, from 2½ h.p. Lightweight to 6 or 8 h.p. Twin and luxurious 4 h.p. Sidecar combination, sold at prices never before thought possible. Write now for full particulars—post free on request—Do it NOW!

The 2¾ h.p. "WOLF" (Model "A") LIGHTWEIGHT.

SPECIFICATION.

ENGINE—The bore and stroke is 70 mm., and it is specified as 2¾ h.p. The main shaft of the engine and the big end have roller bearings, which ensures its smooth running and flexibility, and allows it to quickly develop its full power, and instantly to pick up after being retarded in traffic or on hills.
CARBURETTER Senspray or Amac, latest type, actuated by Bowden handlebar control.
IGNITION—Magneto, high tension, well-known make.
FRAME—Height 28½ ins. from ground, easy riding position, built of best Weldless Tubing, with Accles & Pollock reinforced tubing where required.
WHEELS—James 26 x 2 in. Beaded Edge rims, all black enamelled special tempered steel spokes.
TYRES—We have a special studded tyre named "The Wolf," built for this Model, which we can recommend.
FORKS—Pilot Spring Forks of the latest type. If Druid Forks are required, we can supply at 20/- extra.
TRANSMISSION—On single gear by ¾ in. rubber belt, either Dunlop, Avon or Pedley. Two-speed—Perry's chain from engine to gear, and ¾ in. belt from gear to driving rim. The chain is enclosed in a neat, but substantial steel cover.
FOOTBOARDS—Aluminium, light and easily detached
MUDGUARDS—Wide with side splashers.
STAND AND LUGGAGE CARRIER—Detachable, tubular, of the latest design.
TANK AND LUBRICATION—Well made steel tank with one chamber, containing about 1¼ gallons Lubrication is the usual Petroil self-acting The approximate quantity of petrol and oil is 1 pint lubricating to 1 gallon of petrol; this can be obtained and mixed in the tank at one operation, thus avoiding carrying a separate oil chamber. The engine will consume about one gallon of petrol to 120 miles.
HANDLEBARS AND BRAKES—The Front Brake, Handlebar, and all levers and controls are manufactured by the Bowden Brake Co., Ltd. The bar is neat in design and fitted with two inverted levers, one which actuates the Bowden front brake. The back brake is operated by the foot on the left side of machine.
FINISH AND FITMENTS—Highly polished black enamel to all usual parts. Handlebar, controls, and usual small parts plated. Tank and chain guard enamelled black, with broad gold lines. Fitted with Lycett saddle, tool bag, tools, number plates, oilers, pump and clips. If Lycett Pan Seat Saddle 6/6 extra.



PRICE—Single Gear: £26 - 11 - 6

Other Models.	*Prices:*
Model B 2-stroke	£28 17 6
,, C—2½ Jap	£31 5 0
,, D—4 h.p. -	£41 12 6

A Buyer's Guide to buying "Light"

When you buy a lamp it is not material only—it is not workmanship alone—it is not finish independently—you pay for, but the combination of all three and the experience which has enabled the producer to so combine them as to ensure, at all times, that the lamp fulfils its purpose perfectly—

Therefore you are "buying light."

Therefore, again, before you buy consider well the reputation of the makers—their experience and—the success of their productions.

And, in such consideration, always bear in mind that

MILLER'S LIGHTGIVERS

—"the lamps that won't go out"—are the product of a Company with an experience extending over four decades and a reputation quite unequalled.

Miller merit will please you—Miller dependability ensure your safety under all conditions—even the enforced darkness of the present War period.

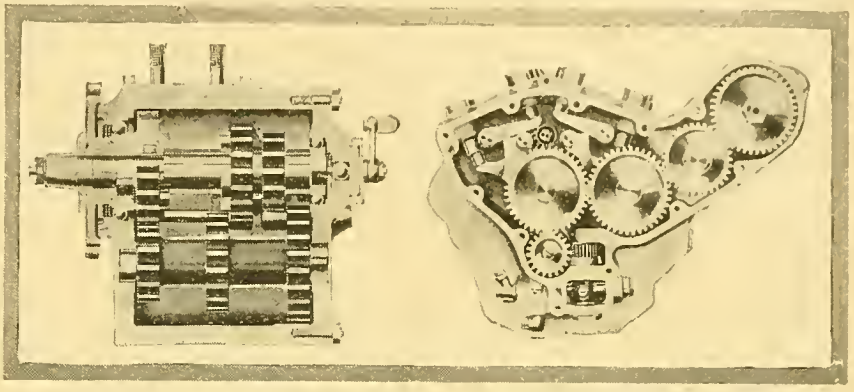
And there are models for every need—prices to suit every purse—so ask your agent.

H. MILLER & CO., LTD., BIRMINGHAM

N.B.—It's a safe guide to tell you to insist on

An Open Letter to the Trade.—

lorries and heavy guns have hammered and battered them ever since, and to-day their surface resembles the craters of the moon as viewed through a 6in. telescope. On my desk lies a letter from an able-bodied professional man of 35. Last month by an incredible miracle of perseverance and wire-pulling he obtained delivery of a brand new 1916 3½ h.p. —— well, one of the very best conventional machines of the day. Last week he advertised it, because his doctor told him the vibration was injuring his spine. Money is very tight, despite the indemnity of £1,000,000,000 of which Mr. McKenna fetches the first instalment from Spandau next week. The roads will not recover inside five years, and we are not going to buy any more rigid frames. You will tell me that the satisfactory springing of a motor bicycle is an awkward problem. I know it, gentlemen. I also know it is soluble. At this moment there rests in my garage a certain machine—again I mention no names, because it cannot be available for the public just yet—with fore and aft springing so ingenious and efficient that I can take it to the roads mentioned by the above correspondent, and cover them without vibration at 20 m.p.h.; without perceptible discomfort at 30 m.p.h.; and at 40 and 50 m.p.h. without more unpleasant sensations than your 1914 machines produced at 20 m.p.h. on the average road surfaces of that date. We buyers rejoice to know that a dozen of you have heeded the exhortations of *The Motor Cycle* and are busily perfecting spring frames by prolonged test on the road; yours are the machines round which we shall crowd at the next Olympia Show.

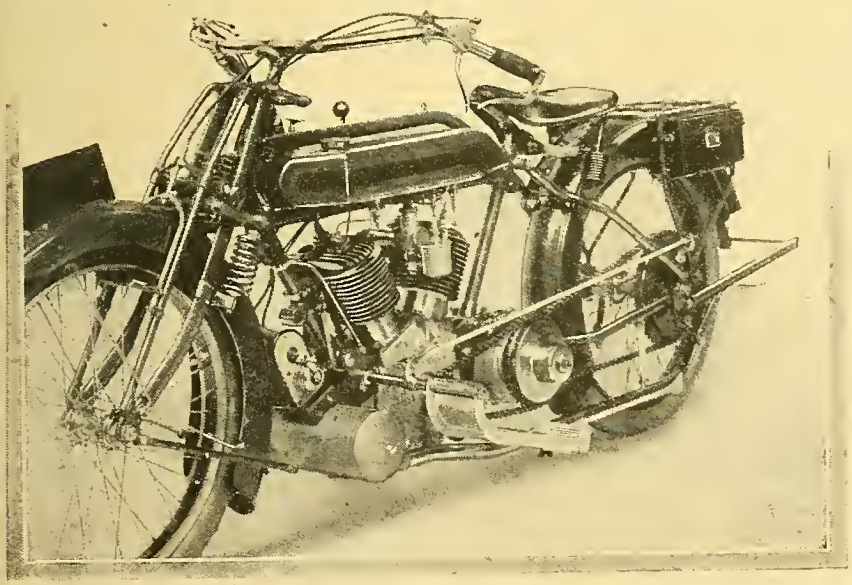


Mechanical features of the 1916 model 7 h.p. long-stroke side-by-side valve Indian. (Left) New design gear box, which has two sliding pinions in place of the single member as in 1915. (Right) Valve timing gear and magneto drive, showing mechanical pump.

The Consumption Question.

Our next anxiety has reference to petrol consumption. The war has made things difficult for the petrol people in many ways: and some of us fancy that the Government monopoly of benzole has enabled them to do more than recoup themselves. There is less love than ever lost between them and us, but that is not your business. Still, here is a point that intimately concerns you. Last week I made a certain journey on a light car equipped with a water-cooled four-cylinder foreign engine. I took a passenger with me, and the entire outfit scaled over half a ton. We used petrol at the rate of 58½ m.p.g. I covered this identical route under identical conditions with a brand new Bristol 2 h.p. two-stroke and a brand new British 3½ h.p. touring machine; the "baby's" consumption was 60 m.p.h. and the tourist's 72½ m.p.h. I do not know what percentage of your customers may be seriously affected by the gross wastage of fuel which such figures prove, nor whether petrol will be cheaper after the war. I put it to you on the highest grounds. You are—or should be—scientific men, and your true scientist's conscience is as sensitive as that of a Christian saint. Will your engineering conscience connive at the continuance of such glaring carelessness and inefficiency?

For many years past we have watched appreciatively your successful development of the single-cylinder engine. The time has arrived for us to say frankly that we are tired of it. It was perfect, regarded as a temporary makeshift. We are now familiar with the infinitely smoother paces of the "baby" two-stroke, we have tasted the power of the Scott twin, and we have gloried in the delicious running of the horizontal Douglas and its imitators. No rider acquainted with such sensations is in the least danger of backsliding towards the thumping one-lunger, or is he likely to become smitten



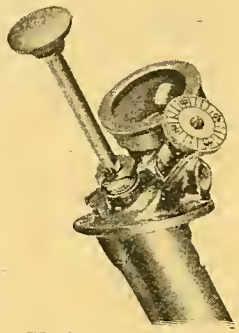
A high-powered machine—the 8 h.p. twin-cylinder Campion—which, with its Jardine four-speed gear and all-chain drive, is a most desirable sidecar mount.

An Open Letter to the Trade.—

with the jig-jiggety firing of the V twin. Yet the majority of you still hanker after the vertical four-stroke single and the unconscionable V twin. Leave the first to the second-hand market and the second to the Yanks, whilst you come on ahead with us. So long as British roads remain, there will be sufficient inevitable vibration without designing engines to produce more.

The Two-stroke Lightweight.

A word must be said about the "baby" two-stroke. The market must cause you some anxiety. The best firms are head over ears in munition work, and a few unscrupulous duffers have been dumping some miserable caricatures on a guileless public, and so threaten to poison a most promising boom. Well, Joffre enters Berlin, and the way lies open for a proper scientific trial of the "babies," to take account of fuel consumption, bearing life, easy starting, even firing at low speeds, absence of vibration, and all the rest of it. Then these get-rich-quick gentry shall go to their own place.



The latest pattern Best and Lloyd lubricator.

I have been asked to suggest that you should list a complete equipment in your catalogues if only as an option. The faddy man, with time on his hands, money in his pocket, and opportunities of inspecting accessory stocks, naturally likes to fit the new machine out in accordance with his own whims. But the practical rider is increasing in numbers. He does not wish protracted delays and manifold expenses to intervent between delivery and use. He wants his machine to arrive ready equipped with lamps, numbers, speedometers, spares, and hooter. At the very least you should imitat Triumph, Rudge, and Douglas procedure by adding to your catalogues a priced appendix of suitable accessories.

Sidecars or Cycle Cars.

I approach the question of sidecars with some timidity. The sidecar is frenziedly popular at the moment. You know it is an unmechanical job from start to finish: you know it is expensive to buy and run, considering what it is. But it sells, and it goes. This is where your trading instincts may wreck the true hope of the light passenger industry, and even betray themselves. The sole alternative is, of course, a "cycle car," an ill-omened word for you, since you have seen a tricar boom and several feverishly-fostered cycle car booms die of sheer internal inanition: and a few of you burnt your fingers rather badly over one or the other. Well, forget all about dividends, shareholders, and the annual meeting for half an hour. Put off the merchant, and put on the engineer. Turn over your well-stored memory. Pull out and glance at, for a moment, your mind-picture of the first push bicycle and the latest, the first motor car and the latest, the first motor cycle and the latest, the first aeroplane and the latest, the Montgolfier balloon and the super-Zeppelin. Done it? Got a prophet's cap anywhere on those pegs in the hall? Fit it on, take a long breath, concentrate your memory and imagination—now then for it, *the first cycle cars and your own 1917 cycle car?*

A little exhausted by the effort, eh, gentlemen? You shall have a wee breather, and then I have done. Become the merchant again for a minute. Been to America lately? Well, anyhow, you know what they are doing. Perhaps you've seen an Argo, a Ritz, or a Saxon? Not quite in your line, I know. But they're brand new, aren't they? Give them two years to grow up. Take the 33⅓% import duty off. Multiply their output by 1,000 *à l'Américaine.* You know. Where will your £120 sidecar outfit *de luxe* be then?

Well, I see Sergeant Smithers has just gone off duty for the day—there he goes back to the station. The sun is shining, and I've a new Brooklands Norton in the garage. No, there's no carrier on it—never approved of that dangerous practice, anyhow. One last drink? No, thanks, I'm on the King's pledge for the war, like so many of you: but we'll have it without heel taps when the Kaiser is interned on the summit of Mount Erebus. To our next merry meeting, I am, gentlemen,

Yours with unfeigned respect,

B. H. DAVIES.

MOTOR CYCLES IN 1916.

A Brief Commentary on the Design of New Models.

IN normal times there is no difficulty in keeping oneself *au fait* with the various manufacturers' yearly amendments in design. The show at Olympia provides that opportunity, but, having been abandoned for the second year in succession, the press alone fills the breach. Perhaps a short review of the most notable machines for next year, which have already been described in these pages, will be of general interest. While the British motor trade is so occupied upon the all-important munitions of war, it is not to be wondered at that the alterations from last year's models are very slight indeed, being confined to detail only in most cases. This we look upon as a blessing in disguise. Instead of bringing out new models, a number of firms have ceased making some of their existing ones, and are strengthening up and improving the detail work. Some firms are not able to produce motor cycles at all. Messrs. Humber, Ltd., are a notable example of this. When circumstances permit they will produce a very attractive mount in the form of a double-purpose 4 h.p. horizontal air-cooled twin, on the lines of the big 6 h.p water-cooled model which has proved so satisfactory.

Among the Horizontal Twins.

Talking of horizontal twins reminds one that when this type of engine was first introduced in the form of the Fairy, and later in 1908 by Messrs. Douglas Bros., it was difficult to convince the public that this was a sound proposition and the forerunner of a popular type. Of late, however, the horizontal twin has been coming into its own, as is proved by the ever-increasing number of firms now listing machines with this type of engine. Even this year, in spite of the war, several horizontal new-comers are to be found, including the Connaught two-stroke and the new 6 h.p. Brough. Perhaps one of the most interesting is the horizontally-opposed twin two-stroke Levis, the first example of which was described in *The Motor Cycle* of July 29th. In this interesting engine, which works on exactly the same principle as the well-known Levis single, the explosions occur in both cylinders simultaneously. It should be mentioned that this model is not yet actually on the market. Of course, the machine which has practically made this class is the Douglas; this wonderful little machine, which, among other achievements to prove its worth, has attained on Brooklands a speed of nearly 70 m.p.h., can now be obtained in either 2¾ h.p. or 4 h.p. models. Very few alterations appear in the standard models of this make, though the firm intends to list a model for the coming year fitted with a very neat spring frame, which depends on two cantilever laminated springs to absorb the road shocks.

The new 6 h.p. horizontal Brough should appeal to the man requiring a double-purpose mount. In spite of the fact that it is fitted with so large an engine, the whole machine presents an extremely neat appearance. In this model a point of interest is that the overhead valves previously used in the Brough horizontal twin have been replaced by valves of the more usual side-by-side type.

The "Growing" Lightweights.

Among those machines which claim to come under this heading there are few now except the baby two-strokes which can genuinely claim to be lightweights. The addition of two and even three-speed gears, clutches, kick-starters, etc., has brought most of them well up to the 150 lb. mark, when, except for the small capacity engine, they can hardly claim this title. It is interesting to notice that most of the pioneers of this type of machine have now grown to such an extent, frequently in both power and weight as well as price, that there would appear to be but little demand for the ultra light machine. No doubt it is not the light weight so much as the low price of these little mounts which makes them so popular.

Though French and Swiss manufacturers were always partial to lightweights. British makers have had to perfect this class, but the introduction of the 1916 Indian baby two-stroke denotes the first arrival of American competition. It will prove quite a novelty so far as this type of machine is concerned, possessing, as it does, a gear box with three speeds, a proper free engine clutch, kick-starter, and chain drive throughout.

At present all the real lightweights have two-stroke engines, but in the 2½ h.p. class the four-stroke is still a rival to the "valveless" engine.

Although some makers are dropping four strokes in favour of the two-stroke, on the other hand, one or two firms who have only made two-strokes have new added a four-stroke lightweight to this range. Notable examples of this are the Calthorpe and the Coventry Eagle Co.'s, which will list machines with 2½ h.p. J.A.P. engines in 1916. The Campion is another example of a four-stroke lightweight. These firms also make models with two-stroke engines.

Sidecar Outfits.

In spite of the criticism of this type of passenger-carrying device, mainly owing to its unmechanical design and the exposure of the driver in wet weather, the sidecar machine is still gaining in popularity. The Clyno Co. are so busy making gun-carrying sidecars for the M.M G.S. that there is little possibility of their producing pleasure machines for a long time to come. Messrs. Brown Bros. are making a serviceable machine under the old name of Vindec. It has a 6 h.p. J.A.P. engine and three speeds.

Mr. Scott's three-wheeler, which is really a permanent sidecar outfit in a weatherproof form, undoubtedly opens up another lease of life for the "cycle car." It overcomes a large number of the disadvantages that the ordinary sidecar presents, especially the driver's discomfort and the difficulty of changing tyres, as all three wheels are detachable and fitted outside the chassis.

The American invasion does not seem to bring so many new makes of bicycles as it does cars to this country. The only new arrivals of recent date are the Excelsior, Yale, Thor, and Pope machines all chain-driven big twins beloved of the Yankee. One of the biggest surprises of the autumn was the fact of the Indian abandoning the overhead inlet valves and detachable cylinder heads that have characterised this machine since its infancy, and which the designers have steadfastly adhered to for so long. Another point where this machine has altered in design is the fitting of the timing gear outside the crank case and covering both the magneto wheels and valve gear under one cover. This was originally done to give more room for a larger big end bearing, but will also be a real benefit when the engine has to be taken down for overhaul. The new twin Indians, too, are of the long stroke variety—which should cheer up Mr. J. L. Norton, who has always been a firm believer in this type.

The four-cylinder Henderson is a powerful machine which has no rival at present—it is a machine apart. Now that the wheelbase has been reduced there is no doubt that it will appeal even more than before to the rider who delights in the luxurious running of a powerful car, yet requires the handiness and convenience of a motor cycle.

The Harley-Davidson completes the entire list of Americans over here. This luxurious outfit has caught the favour of the British motor cyclist in surprisingly quick time.

Fittings and Accessories.

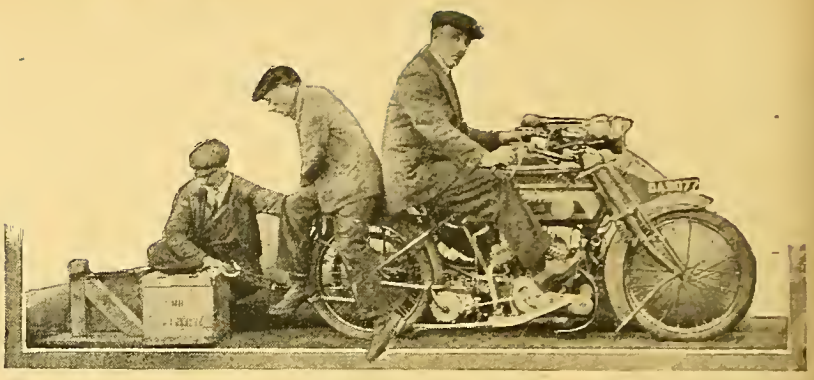
To turn to the question of spring forks, gear boxes, clutches, lubricators, carburetters, and the like, we find many detail improvements. Even among lubricators of the drip-feed type, we find a number of small improvements, although various forms of mechanical lubricators are becoming more popular. Among machines fitting some form of this system we find such machines as Enfield, Indian, and Harley-Davidson. The latest pattern of J.A.P. engines are also fitted with a device of this kind.

The countershaft three-speed gear is now practically a standard fitting, at any rate on machines of 3½ h.p. and upwards, though four speeds are receiving a certain amount of support. The new Jardine countershaft gear, in addition to several other makes, has a fourth speed incorporated. By utilising the kick-starter pinions in such a way that they furnish the low gear train, it is no more complicated. The Zenith and Rudge machines are now practically the sole representatives of the infinitely variable type of gear, although the Philipson pulley is still very popular as a simple light compromise for people who prefer the simplest type of machine.

Rear springing systems are gradually beginning to be looked upon as desirable standard equipment. Among the newcomers in this direction we have the Royal Ruby, Matchless, and Douglas, and satisfactory results are obtained from such machines as the Indian, Edmund, Bat. P.V., A.B.C., and Pope.

A NOVEL TEST OF ENGINE AND CLUTCH EFFICIENCY.

A Practical Test Providing Useful Information.



Preparing to test the 5-7 h.p. twin Abingdon.

RECENTLY a novel and interesting form of competition, in which a number of Leeds and Bradford motorists took part, was organised by the Headingley Motor Co. at their Leeds premises. A variety of machines having been obtained, each, in turn, was attached to a set of spring scales, and readings were taken as to its pulling capabilities on the various gear ratios with which it was provided.

This novel test opens up many interesting lines of enquiry, but it will readily be understood that the results obtained were almost as much dependent on the efficiency and the progressive action of the clutch as on the pulling capabilities of the engine. With most of the machines it was found that the same reading could be obtained time after time, the engine beginning to "konk out" each time the pointer reached the deciding figure. This fact alone speaks well for the efficiency of modern clutches. With one or two of the machines, however, much difficulty was experienced in obtaining an accurate reading, the tendency being for the clutch to bind solid suddenly after a few seconds of slipping in half engagement.

This difficulty was experienced only with the metal-to-metal expanding ring clutches, which, with the exception of the P. and M., were all susceptible to a certain harshness of engagement. The pointer of the spring scales recorded very accurately the smoothness of engagement, and with the expanding ring type of clutch it was very difficult to obtain a steady reading with the engine pulling at its best. Only too often the clutch would suddenly grip and stop the engine, and, though this type of gear has the desirable features of reliability, simplicity, and foolproofness, it cannot be regarded as so ideal in action as, for instance, the multi-disc type.

In the case of the machines fitted with hand-controlled multi-disc clutches no difficulty whatever was experienced in obtaining a reading. Each machine was tried several times, and there was seldom variation of more than 3 lb. or 4 lb. in the different readings.

The Results arrived at.

The object of the trial was, to test (1) the efficiency of the various clutches employed; (2) the comparative pulling powers of the engines of various cubic capacity; (3) the power actually conveyed to the road wheels on the different gear ratios provided.

This seems simple enough on paper, but it is only to be expected that bewildering and contradictory results are to be obtained in practical test. It was generally found, for instance, that, though the engine speed was kept constant, the machine that could pull 50 lb. on a 4 to 1 gear could pull very much more than 100 lb. on an 8 to 1 gear, though one would naturally anticipate a certain loss of power by the friction of the gears on the lower ratio.

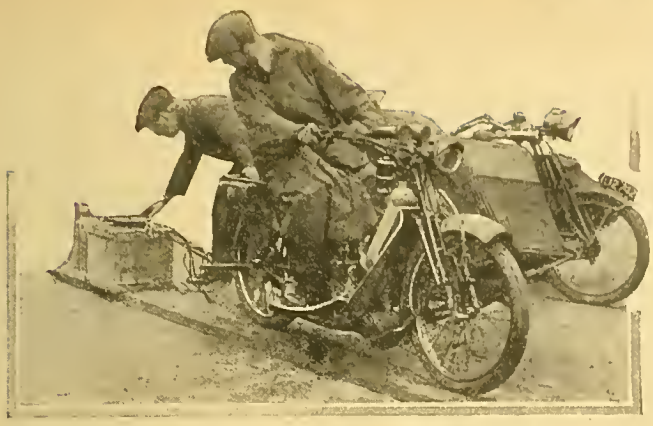
How the Test was carried out.

The machines to be tested were placed on a dry plank, erected at one end of which was a strong post. To the post was secured the spring scales, and the machine was harnessed to the latter in such a manner that, when desirable, the scale registered half the energy exerted.

The accompanying table gives at a glance the results produced. It will be seen that in the last

Machine.	H.P.	No. of Sp'ds	Drive.	Gear Ratios.			Pull Exerted in lb.			Comparison of Engine Power on Top Gear at Common Ratio of 4.5 to 1.	H.P. at Road Speed of 20 m.p.h.	C.C.	Remarks.
				Top.	Mid.	Low.	Top.	Mid.	Low.				
1914 Sunbeam	3½	3	Chain	4.9	8.2	13.7	70	120	204	64 lb.	3.7	499	Clutch action excellent.
1914 Sunbeam	6	3	Chain	4.5	7.5	10.5	110	170	270	110 ,,	5.9	770	Clutch action excellent.
1914 P. and M. ...	3½	2	Chain	4.8	—	8.4	65	—	115	61 ,,	3.5	498	Steady engagement.
1915 Abingdon	5–7	3	C. & B.	5.3	8.7	16.4	135	180	320	110 ,,	6.65	796	Belt slip.
1914 Matchless	7–9	3	Chain	4.5	8.2	11.0	100	190	280	100 ,,	5.33	994	Steady reading.
1914 A.J.S.	6	3	Chain	4.75	7.5	16.0	61	130	250	58 ,,	3.3	696	Engine in dirty and neglected state.
1914 Scott	3¾	2	Chain	3.75	—	6.8	60	—	120	72 ,,	3.2	532.5	Fierce clutch.
1915 Edmund-Jap .	2½	2	Chain	4.6	—	8.9	30	—	70	29 ,,	1.8	292	Fierce clutch.
1915 Edmund-Levis	2½	2	Chain	4.6	—	8.9	35	—	80	34 ,,	1.9	293	Fierce clutch.
1914 Bradbury	4	3	Chain	5.2	8.5	15.0	90	150	240	78 ,,	4.8	554	Clutch action excellent.

H.P. constant = 0.0533, by which to multiply the pull in pounds at 20 m.p.h.



The Scott, ridden by H. O. Wood, pulling 120 lb. on its low gear.

column is entered the actual horse-power conveyed to the road wheel on the top gear with which the machine is provided, while the column next to it shows the actual pull exerted by the various machines at a common gear ratio of 4.5 to 1. From this we obtain the comparison that while two of the 5 h.p. machines each pulled 110 lb., the two 2½ h.p. lightweight machines pulled 29 lb. and 34 lb. respectively, the two-stroke beating the four-stroke. Therefore, if 34 lb. represents 2½ h.p., 110 lb. represents 9½ h.p., which is not so bad for the twin.

At all events these figures help us to realise the folly of overloading small solo mounts.

The column also points to the distinct advantage of the big twin for sidecar use. Whereas on a 3½ h.p. machine it becomes necessary to change down from a 4½ to 1 gear when the machine is exerting a pull equivalent to 63 lb., the change is not necessitated in the case of a 5 h.p. twin till a pull is equivalent to something in the neighbourhood of 107 lb. And while apparently the average twin is capable of exerting a pull of about 120 lb. on its top gear, it is doubtful whether the average 3½ h.p. single is capable of exerting a pull of 60 lb. on its top gear unless that gear be unpleasantly low.

The column showing what the machines actually pulled on their bottom gears points an emphatic finger to the advantage of a really low gear. Note that the Abingdon King Dick, with its low gear ratio of 16.4 to 1, tipped the beam at 320 lb., and also that the 3½ h.p. Sunbeam, with its low gear of 13.7 to 1, is enabled thereby almost to hold its own with the twin-cylinder machines when it comes to climbing. Really at all times the low gear is merely an emergency provision, so why not have a provision that is sufficient for an extreme emergency?

The Results.

Dealing briefly with the machines as they came, the 3½ h.p. Sunbeam was the first to toe the mark, and started off with a bark fragrantly reminiscent of the good old competition days. The clutch of this machine and of the twin Sunbeam that succeeded it was all that might be desired, and the twin ran beautifully steadily and without apparent exertion on the heavy load. Some little delay was occasioned with the latter owing to the clutch plates becoming hot and refusing completely to disengage, but, having cooled down, the clutch was as sweet in action as before.

The P. and M. was the only machine with expanding ring clutches that caused no difficulty. Both gears engaged in proper proportion with the movement of the controlling lever, and the friction surfaces showed no tendency to seize suddenly together after a few seconds of slipping.

Surprising Power of the Abingdon.

Some little excitement was experienced with the Abingdon "King Dick," which obtained the highest readings for the day. Having piled sundry spectators on the carrier to prevent rear wheel spin, the belt began to slip, and, this remedied, it was still found impossible to subdue the vitality of the engine till the cork insets of the clutch began to burn. The fire extinguisher was produced, and the highest reading yet obtained was taken as a fair estimate.

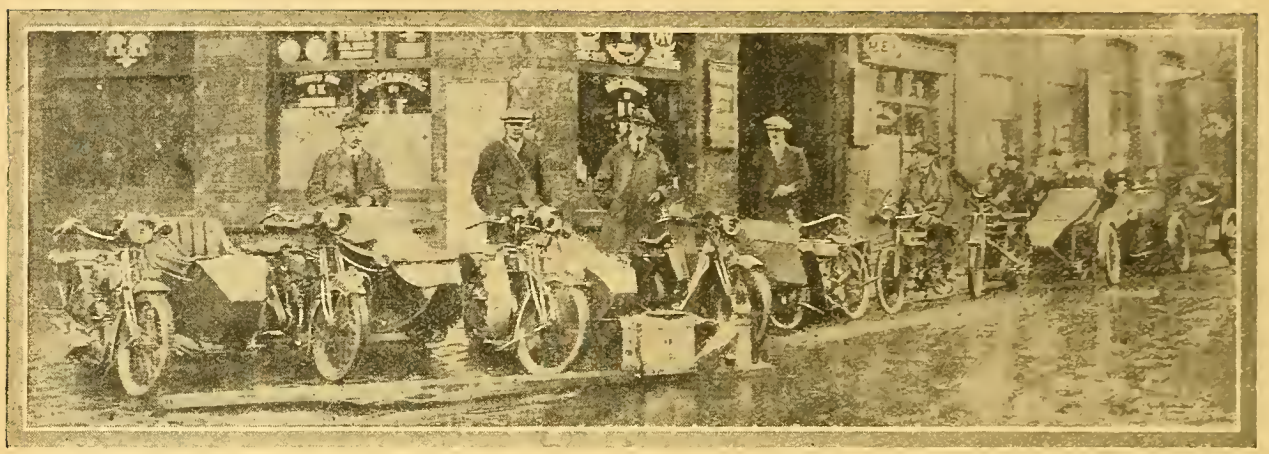
The Matchless behaved well, but the A.J.S. was out of condition after two years of hard use. We would omit the entry were the merits of the A.J.S. less generally known, but since the reputation of this machine is established, we give the figures on account of their interest. Here we have a machine in a neglected and flabby condition, but which, with its emergency gear of 16 to 1, is capable of exerting a pull of 250 lb.

Difficulty with Expanding Ring Clutches.

A twin-cylinder Royal Enfield next brought to the test refused to submit to such plebeian treatment, the clutches being too fierce to render a reading possible. Similar results were experienced with the Scott, which would insist on jerking the scales up to and beyond the 400 lb. limit, stopping its engine in the proceeding. Yet anyone who has ridden one of these machines and knows the thrills of a foot-controlled clutch which can be made to grip instantly, together with absence of flywheel weight and an engine that roars off the mark, can testify that the clutch and the engine are an exact combination. The final readings obtained, however, were just, and, considering the gear ratios employed, they are very creditable.

The Edmund Levis and the Edmund J.A.P. were both suffering from the fierce clutch epidemic, but

The P. and M. was the only machine fitted with expanding ring gears that occasioned no difficulty in obtaining a reading.



Some of the machines and riders outside the Headingley Motor Co.'s premises at Leeds, at which the trial of engine and clutch efficiency was made. Note the testing instrument in the foreground.

since the Enfield gear is almost ideal for these small machines when it comes to practical use, the results must not be taken too seriously. It may be mentioned that the clutches engaged much more sweetly on the two-stroke than on the four, probably owing to the more even torque of the engine.

The 4 h.p. Bradbury behaved excellently, and it is interesting to learn that the "big single" really *is* capable of developing slightly more than the popular 3½ h.p. single, a point many of us may have doubted.

The Instrument Kept as a Standard Fitment.

This trial has proved interesting in many ways, and though, of course, the results obtained open up many subtle enquiries to the theoretically minded, the Headingley Motor Co. and their friends are to be congratulated on having carried into practice a most original competition. The instrument has now become a standard fitment in the garage of the above-named company, and any rider who enquires "Is my mount developing its full power?" is in a few moments able to ascertain how his machine pulls in comparison with others of its cubic capacity. If there is any question as to clutch or belt slip, a few seconds on this test is calculated to settle any doubt, though it cannot be pretended that prolonged tests of this kind would prove particularly good for any part of the transmission.

H. MORTIMER BATTEN.

An American Opinion.

THE following are extracts from an interesting letter received from Mr. E. B. Holton, of New Jersey, a member of the "Federation of American Motor Cyclists." His views are particularly instructive as representing the American opinion on the subject of many motor cycling matters. He writes:

"This letter will be rambling because I have a lot to say. First, I want to congratulate you on the efficiency of your paper in covering every phase of motor cycling in every quarter of the globe, also for the way you are so intimately in touch with the riders.

"Our American motor cycle papers lack that get together tone, because they have no 'Letters to the Editor' pages. Whether this is due to the fact that American riders are not great at letter writing I do not know, but the lack of these pages is to be deplored.

"Another thing that interests me is the difference in the slang in the two countries. Motor cycling is a sport that is essentially the same both in England and America; still the language is altogether different in many cases. For instance, your riders 'konk out,' we 'stall'; you use 'petrol,' we 'gas'; you are 'all out,' we 'open wide,' etc.

"We have a growing coterie of lightweight manufacturers, but with the roads of the States none too good I cannot see where the market will be very large. A lightweight will have the touring radius of a bicycle, for the real lightweights have not enough speeds to negotiate steep hills as found in many States.

"From photographs published in recent issues, I should judge your roads are rapidly becoming as bad as ours. American practice is to build a good road, then let it gradually wear out without any effort to save the road surface at all.

"I have just been at work on an article regarding sidecar accessories. We are without many of the refinements that make the sport attractive in wet or cold weather, but have hopes that some keen manufacturer will see the chance and grasp it. We need waders, good ponchos, oil skins, trunk and tyre racks such as the English motor cyclist has.

"I will now pass on to endurance runs. The New Jersey M.C. two days' run was quite a contest; but I have come to the conclusion that the secret check is a thing of the past.

"Our run was over a 435 mile course, with eleven secret checks, and the whole affair became a guessing contest rather than a competitive event in which the machines figured largely. The Indian team out-guessed the Harley-Davidson riders in locating secret check stations; therefore, they won.

"The ideal two-day contest—in our section—is a 450-500 mile course over such abominable roads as to cause the competitors' anxiety over their ability to hold to a 20 m.p.h. schedule. We can find sand and clay roads enough for this type of run, too, but feel that something regarding flexibility and hill-climbing ability should be brought out as well.

"Now, if one of those sneaking German U boats does not attack the ship which carries this letter, I shall expect to see it, or some comments in regard to it.

"At one time I marvelled at the English T.T. handle-bar, but since riding a Harley equipment with a semi-racing bar I agree with 'Ixion' when he favours a bar that causes one to throw some weight on the front wheel. The added sense of security in loose stuff is great.

"Newark, N.J. "ERNEST B. HOLTON."

QUESTIONS AND REPLIES

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, London, E.C., and whether intended for publication or not **must be accompanied by a stamped addressed envelope for reply.** Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

Side Play on Connecting Rod.

My machine is a baby two-stroke, and has run about 2,200 miles. On taking down engine for decarbonising, I find there is considerable *lateral* play on both big and little ends of connecting rod. Should this be taken up, or is it immaterial? There is no "up and down" play.—A.O.H.

Side play on either end of a connecting rod does not matter; vertical play is all that matters. Of course, it is just as well not to have an excess of side play, especially at the gudgeon pin end. The idea of allowing slight side play is so that the connecting rod can find its own central position between gudgeon pin and crank pin without any risk of strain through being lined up incorrectly.

Tuning Up.

Will you tell me how to obtain more speed out of my 3 h.p. twin? The exhaust and valve opens 15 mm. from the bottom of the stroke and closes on top. The inlet opens 2 mm. after the exhaust has closed, and closes at the bottom of the stroke. The magneto fires 3 mm. over the compression stroke with the spark retarded and 3 mm. from the top of the compression stroke when advanced. The tappets have 4/1000ths clearance. The engine will only do 30 m.p.h. all out, and slows up on small hills. If I slow down to 6 m.p.h. the engine snatches, and when I try to get away again the same thing happens. When I try to start in high gear (5½ to 1) the front cylinder gets a light straw colour after about five miles running. The front cylinder gets plenty of oil as the piston gets carbonised, but I cannot cure the overheating.—O.W.Y.

The timing of your machine seems to be perfectly correct, and we do not suggest your altering it. Evidently there is loss of power through wear or want of adjustment. Perhaps the valve springs have become too weak and require renewing, or the carbureter requires adjustment. The fact that the engine overheats so badly that the front cylinder gets red hot is a sure enough indication that things are not as they should be. No wonder you cannot get speed if this happens. The engine needs to be taken down and thoroughly examined by an expert. Possibly new piston rings are needed, and the valves require to be ground in. You might also try a slightly smaller jet.

Excessive Vibration.

I have a 2¼ h.p. two-stroke machine which runs very well, with very good mileage per gallon. I can do 100 m.p.g. in level country. What is the cause of excessive vibration on the handle-bars? The spring fork is free, and the tyres are 26×2¼, not pumped too hard. It seems like engine vibration. What can be done to prevent it? The piston is rather heavy, much heavier than the piston of a four-stroke I owned previously. Does your book on "Balancing of Motor Cycle Engines" deal with two-strokes?—Ivy.

The vibration is always rather excessive on two-stroke singles, but nothing can be done except to have the engine re-balanced. The same formula would be used for a single-cylinder two-stroke as for a four-stroke. Thus the book on balancing applies equally to both. You should make sure that the engine is securely bolted into the frame, as, if this were not absolutely tight, it would exaggerate any vibration.

Difficult Starting.

My machine is a 1915 2½ h.p. four-stroke, fitted with two-speed countershaft gear, Senspray carburetter, and fixed ignition, the platinum points being timed to open as the piston reaches the top of its stroke. I run along in bottom gear with exhaust raised to start up. On dropping the exhaust lever nothing happens. On raising it again a moderately loud backfire takes place. This happens two or three times, the backfire getting louder each time, until the machine suddenly starts off. On changing into top gear no explosion takes place until the exhaust lever is raised for an instant, when a loud backfire takes place, and the machine either starts up or else stops. I should be much obliged if you could help me in the matter. The machine runs well once it gets going.—R.B.D.

Probably you flood the carburetter too much before starting, and there is too much petrol, causing the mixture to be so strong that it cannot be ignited. Raising the exhaust admits air into the cylinder, and after this has been done once or twice the excess of spirit is evaporated. With this make of carburetter it is advisable not to flood it at all before starting, or, if it is absolutely necessary, only depress the plunger once or twice.

Magneto for Vertical Twin Engine.

I have a vertical twin engine, 5-6 h.p., with cylinders side by side. I require a magneto for it. Could you advise me what degree magneto is required?—W.H.F.

If the pistons of your engine both rise and fall together, the engine is intended to fire at every revolution of the crank. You will require a magneto similar to those used on machines such as the Douglas, viz., 180°. In this case it should be run at half engine speed. If, however, the cranks are set at 180°, that is, one piston at top of stroke while the other is at the bottom, the explosions will occur in quick succession, with a long interval until the next two explosions. In this case the same magneto will do, but will have to be run at engine speed. It is important to note that two non-effective sparks will occur at the end of each exhaust stroke; this, however, will not affect the running of the engine in any way.

Misfiring.

I have a new 1915 machine fitted with a 1915 B. and B. carburetter and Dixie magneto, which runs very well along level or undulating roads, but as soon as I come to a long hill and open up the throttle, it runs about 500 yards and then misfires itself to a standstill, unless I almost close the throttle again (full air), when it fires regularly, but, of course, without sufficient power on such a small throttle opening. I have tested the sparking plug and the wiring for shorting, but everything seems to be all right. I have cleaned out the carburetter and petrol pipe, so there is no shortage of petrol; it is correctly adjusted, and the slides work properly. I have tried two new plugs, but it makes no difference. Can you tell me from this what the trouble is, or make some suggestions as to the possible cause? I may say that the timing of the valves and spark has been checked by a local expert; also, the valves do not stick in the guides. Could such a trouble be caused by pre-ignition? If so, how could it be prevented?—L.C.F.

The trouble seems to be due to too large a jet, which causes the engine to choke through too strong a mixture. The trouble could be caused by the ignition, but we hardly think the symptoms point to this, especially if you have tried two different makes of plugs.

Lighting from Magneto.

(1.) I have a fairly large single-cylinder Simms magneto, giving a good hot spark. I wish to convert this into a dynamo to light three lamps, also to give a spark for a twin engine. Of course, I shall have to fit a contact breaker for this. Could you enlighten me as to the necessary operation for converting? (2.) My present mount is chain-countershaft driven, and is geared 6 to 1. I wish to gear it 5 to 1. What number of teeth on the engine sprocket would I require, $\frac{3}{8}$in. × $\frac{1}{4}$in. pitch? Countershaft, forty-five teeth on big wheel, seventeen teeth on small wheel; back wheel (26in. diameter), thirty-eight teeth on sprocket.—E.Y.

(1.) We do not think you would be able to light the lights and at the same time use the magneto for ignition purposes on a twin. If you want to use the magneto for lighting purposes only it is possible to do so by connecting the lamps in a circuit formed by a wire from the switch terminal on the contact breaker, and one from the frame of the machine. It is possible to light a small lamp suitable for tail light purposes only by taking the wire from the switch terminal to a choking coil and from that to the tail lamp of about 2 volts. This enables you to draw a small proportion of the current to light the lamp and still leaving sufficient to produce a good high-tension current for ignition purposes. (2.) In order to obtain the gear ratios of a countershaft-driven machine it is necessary to multiply the number of teeth on the driving sprockets together, also the driven, and divide the product of the driven by the product of the drivers; this will give you the gear. The following is the method of working it out for your machine, X being the number of teeth in the unknown sprocket (the engine):

$$\frac{45 \times 38}{X \times 17} = 5$$

$$45 \times 38 = 5\,(X \times 17)$$

$$X = \frac{45 \times 38}{5 \times 17} = \frac{342}{17}$$

$$= 20 \text{ teeth.}$$

Therefore, twenty teeth on the engine sprocket is what is required to give a gear of 5 to 1.

Exhaust Valve Sticking in Guide.

(1.) My exhaust valve keeps sticking up in its guide, and this has happened twice within 300 miles. The first time I cleaned the valve stem and replaced it, but this lasted for roughly 300 miles, when I replaced the valve with a new one. (2.) My compression tap has to be taken off and cleaned after about 100 miles, or after about five or six runs (engine allowed to get quite cold). Unless I clean this tap I cannot inject petrol into the cylinder as it is choked with burnt oil. My machine is a 4 h.p. Triumph. The oil I give is Vacuum T.T., one pumpful every five miles.—R.T.

(1.) The exhaust valve sticks up probably because it is too tight a fit in the guide, or slightly bent. We should recommend you to rub the stem down with emery, and dust a little blacklead round it. See, also, that the guide is quite clear, and that the valve is working freely in it when warm. (2.) You need not trouble to take the compression tap off to clean it. You should push a piece of fine wire down the centre when the tap is open. You can clean it quite well enough to allow you to inject petrol for starting. Half a pumpful of oil every five miles should be enough.

Overheating.

(1.) What is known as overheating, and should the crank case get hot at all? If so, what is the extent to which this may be regarded without alarm? I am rather mixed in regard to this matter generally. (2.) What is a good test for compression, and how is this to be judged, *i.e.*, how am I to know whether the compression is good or bad? (3.) What may be regarded as a fair consumption of petrol, *i.e.*, how many miles per gallon? I am at present using the machine (a 5-6 h.p.) with sidecar on the hills, where I have frequently to climb steeps of varying gradients from 1 in 20 to 1 in 4. But I will shortly be down in the plains again.—M.V.H.C. (Simla, India).

(1.) Overheating occurs when the cylinder reaches such a temperature that the expansion of the gas is so rapid, that a sufficient quantity cannot be drawn in, and so the engine cannot maintain its normal degree of efficiency. The heat also burns up the lubricating oil, and is liable to cause a seizure. The crank case often gets hot through conduction, and there is no great harm in this. (2.) You can tell fairly well by trying to overcome the compression. If there is considerable resistance the compression is good. (3.) The consumption of petrol will be between 50 and 60 m.p.g.

READERS' REPLIES.

A Cracked Crank Case.

Your correspondent "S.H.," in the issue of November 11th, asks for a suggestion for leaking crank case. I fractured mine and had the same trouble, through a slightly twisted frame. I straightened the frame, and then carefully hammered the fracture in crank case both inside and out. This was some years ago, and it is still satisfactory now. —J.H.K.

Difficulty in Starting.

Referring to "W.W." in your issue of November 11th and your reply thereto regarding difficult starting, I at one time experienced the same trouble, and was more than once "held up." I came to the conclusion eventually that it was due to the sparking plug points being too far apart. Correcting this has stopped the trouble. The puzzle is why an explosion should occur upon the release valve being lifted. I am not an electrician, but imagine that under normal pressure a spark can jump a larger gap than if under compression. Would this explain it?—H.C.

EXPERIENCES WANTED.

Readers desirous of obtaining the experience of others with various motor cycles or accessories must enclose a stamped addressed envelope in which the replies may be forwarded. Answers to the queries should be addressed c/o The Editor.

"R.W." (Stirling).—Triumph two-stroke with Everest or Binks carburetter, slow running.

"H.R.B." (East London, S.A.).—A.B.C. Reliability, lubrication, durability, petrol and oil consumption, and smoothness of chain drive.

RECOMMENDED ROUTES.

LIVERPOOL TO BERKHAMPSTED.—J.D.A.

MOTOR CYCLES FOR SALE.

Enfield.

ENFIELD 1916 Combination, Lucas horn, head and rear lamps, only just taken delivery; selling solely because doctor forbids riding; cost over £92, receipts shown; sacrifice £88, or near offer.—Davies, 196, Caledonian Rd., London, N. [6365

ENFIELD Combination (1914), done 3,800, perfect, every accessory, Lucas lamps, only lit twice, loog horn, speedometer; expert examination invited; £65, spot cash.—Seen at Bafeco, 10, North Mews, Gray's Inn, W.C. 'Phone: Central 2366. [6368

1913 Enfield 6h.p. Combination, Lucas sets, Klaxon and bulb horns; the whole turnout is in new condition, and has been very little used; mileage under 3,000; price £50, or nearest.—Bromley Motor Works, Mason's Hill, Bromley, Kent. 'Phone 961. [6507

ENFIELD Newest 1916 Combination, delivered from stock, also 1915, electrically equipped, hood and screen; £90, bargain; deferred payments arranged; strictest privacy observed.—Lamb's, 151, High St., Walthamstow, and 50, High Rd., Wood Green. [6432

ENFIELD 1914-5 6-8h.p. Passenger Combination, Lucas dynamo lighting set, Palmer tyres, new spare tube, lot of spares, exceptionally powerful machine, splendid order and condition; £70; seen by appointment.—Bishop, 2, Victoria Rd., Oxford. [X4829

1914 Enfield Combination, complete with lamps, horn, speedometer, mirror, watch, sidecar complete with hood and screen, machine in splendid condition; this belonged to an officer, and has not been used since the commencement of the war, except for 7 days; £65.—Juban, Broad St., Reading. 'Phone: 1024. [X2347

Excelsior.

EXCELSIOR (American), 7-9h.p., 1915, standard model; £62.—Box L95, *The Motor Cycle* Offices, 20, Tudor St., E.C. [6458

1914 Excelsior (Coventry) Coach Combination, 4½ h.p., 3-speed, kick starter, speedometer, good condition, accessories; £50.—Pipler, Poole. [6576

AMERICAN Excelsior, 7-9h.p., 3 speeds, electric equipment, and coachbuilt sidecar, as new, perfect; 50 gns. to clear.—Percy and Co., 337, Euston Rd., London. [6486

EXCELSIOR (American), standard 7h.p. model, £80; De Luxe, £90; very liberal exchanges quoted; we can surprise you.—Sole Yorkshire Distributers, Halifax Motor Exchange, Horton St., Halifax. [0360

AMERICAN Excelsior 1914½ Coach Combination, 7 h.p., mag., 2 speeds (countershaft), lamp, horn, speedometer, beautiful order; any trial; 49 gns.; exchange lightweight.—1, Ebner St., Wandsworth, London. [X4713

EXCELSIOR (British) 2-stroke!—Latest 2¼h.p. model in stock, £30/16, the famous hill-climber. Wire and secure one of these famed Coventry machines.—Alexander's, 115, Lothian Rd., Edinburgh. T.A.: Motocycles. [5144

Forward.

2¾h.p. Twin-cyl. Forward, 3-speed gear model, a real little gem, economical and fast; £29, guaranteed.—Wauchope's, 9, Shoe Lane, London. [X4819

F.N.

F.N., with sidecar, 1912, 5-6h.p., mag., Multi clutch; £25/10.—1, Ebner St., Wandsworth. [X4715

1911 F.N. Motor and sidecar, in first-class condition; cash wanted, £13/10.—F.N., 1, St. Mary's Mansions, Newington Butts, S.E. [6427

F.N., 5-6h.p., 4-cyl., Bosch mag., 2½ tyres, B. and B., h.b.c.; any trial; carefully used machine, and a gift for £12/12, or very near offer.—J. Boulter, 12, Albion Place, Winchfield, Hants. [6526

F.N., 1912-13, 2¾h.p., 2-speed, hand clutch, shaft drive, new Dunlop tyres, P. and H. head lamps, generator, fully equipped, easy starter; seen by appointment; £28.—Baxter, Chislehurst. [6607

5-6h.p. 4-cyl. F.N., fitted with 2-speed gear and handsome coachbuilt sidecar, the combination complete with all accessories; 40 gns.; any severe trial given; tuition free; guaranteed.—Wauchope's, 9, Shoe Lane, London. [X4803

Grandex.

2¾h.p. Grandex, fitted with 3-speed gear and free engine, superior lightweight; £20; guaranteed.—Wauchope's 9, Shoe Lane, London. [X4804

Harley-Davidson.

HARLEY-DAVIDSONS in Stock.—Premier Motor Co., Birmingham. [4734

BARGAIN.—Nearly new Harley-Davidson, 4h.p., 11C model, 2-speed, in absolutely perfect order; 45 gns.—Railway Garage, Staines. 'Phone: 46. [6395

HARLEY-DAVIDSON, 7-9h.p., 11J model, electrically equipped, new, also Harley-Davidson 20 gn. sidecar; bargain, £89.—Eldridge, Fordingbridge. [6662

HARLEY-DAVIDSON Combination, electric model, new August, 1915, will cost £100 to-day, tyres unpunctured, little used, perfect; £80.—Shackleton, Jeweller, Sowerby Bridge. [X4848

HARLEY-DAVIDSON, 7-9h.p., 3-speed, September, 1915, done 500, tyres unpunctured, Canoelet coachbuilt sidecar, spares, guaranteed perfect; best over £70 cash.—Lieut. Farrington, M.M.G.S., Bisley, Surrey. [6600

Aluminium Pistons.

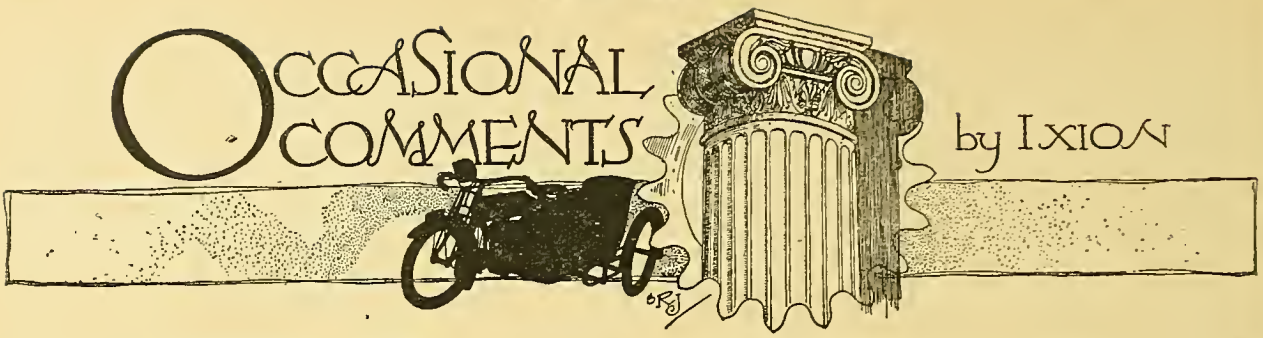
IN this issue we publish an authoritative article on a little known subject, viz., the employment of aluminium—or, rather, aluminium alloy—pistons in internal combustion engines. This material was adopted originally on account of its remarkable lightness, but the tests to which it has been put have brought to light a number of other inherent advantages which render an aluminium alloy piston peculiarly suitable for the requirements of an air-cooled petrol engine. Though the use of aluminium alloy for pistons is at the moment confined to car and aeroplane engines, it is very clear from the facts enumerated by our contributor that before long the aluminium piston will figure largely in motor cycle engines—possessing, as it seems to do, just those peculiarities which commend themselves to the notice of air-cooled engine makers. The fact that an aluminium piston has no tendency to seize, even if on the tight side, but instead conveniently laps itself in, is a particularly attractive point in the case of an air-cooled engine running at high temperature. Again, the fact of aluminium being such a light material enables a design to be employed embodying a good deal of metal. Now aluminium is a fine heat conductor, and consequently the increased thickness over the usual cast iron piston assists in conducting the heat from that important yet most vulnerable point, the piston head. By this means the heat in the head is quickly reduced, and consequently the oil which reaches the top of the comparatively cool piston is not nearly so likely to be carbonised on to the head. The question of carbonisation is still a difficult one with all types of motor cycle engines, particularly two-strokes, for carbon—caused by oil finding its way past the rings and being burnt on to the piston—leads to knocking, and the only way to get rid of it is to dismount the cylinder frequently in order to remove all traces of carbon. There are still other advantages to be derived from the use of aluminium, but those already enumerated would in themselves be sufficient to warrant enterprising manufacturers devoting their attention to the matter, and after careful study of the subject we are of opinion that aluminium pistons will figure largely in motor cycle engines.

A Standard for Reduced Lighting Required.

FOR many months past motorists have badly needed information on the question of reduced lighting. It has been impossible to obtain an official definition of a powerful light, yet motorists have been summoned and mulcted in fines for innocently using lamps which are considered powerful in the official eye. The curious part is that lights which are sanctioned in one district are not approved in another. We, personally, were requested to reduce our lights in a certain district, though the same electric lights had been in regular use for six months all over the country. After all, it is most unfair to leave the important decision as to whether a light is powerful or not to the average constable, and the personal factor should be eliminated, or, at any rate, motorists should be given some definite standard upon which to work. This we believe, from a hint which has reached us, is about to be done, and we should now like to urge that the whole matter be cleared up at one operation, and the position made clearer as to when lights must be reduced on approaching a town, and also when they can be raised on leaving the outskirts of that town. The latter point is not so necessary as the first, except that, in some populated districts, street lights continue from one town or village to the next, and even for miles on end; so that those who go by the fairly common rule of switching on their head lights immediately they have left the street lamps behind are sometimes unduly inconvenienced. We do hope the authorities will this time appreciate the position in its entirety and settle the question once and for all.

An index to the advertisements in this issue will be found on the page facing the back cover

Occasional Comments by Ixion



Combination Treads.

Two members of *The Autocar* staff inform me that I am quite wrong in supposing that the rubber bars rip off combination treads under the stresses of heavy car work. This fact is hardly germane to these columns, but, as I dragged it in before, I must drag in a correction. It is curious that these combination covers are comparatively uncommon on large cars, when they are so emphatically the goods for real grease on two-wheelers; and I had been led to adopt the above—apparently incorrect—explanation. Expense is possibly a factor in the matter.

Wire Control for Rear Brakes.

Anent my remark on the probabilities of Bowden wire gaining a greater vogue in brake control gear for rear sprung frames, the Bowden wire people remind me that the A.J.S. and Zenith machines both already employ this mode of operation. The incipient demand has led the makers to increase their range of fittings and to manufacture adjusters with a suitable margin for such purposes; when the big demand comes, as the result of the spring frame movement, they will be quite ready to cope with it.

The Sporting Single.

One and the same post brought me a mournful wail from a twin enthusiast ("Why have the J.A.P. people stopped making their divine 90 × 77½ mm. twin—nothing but dreams of it sustain me through the dolours of active service!"), and also a glowing letter from an officer employing the pseudonym "Raving Maniac No. 2," whose message may comfort the bereaved J.A.P. owner. This officer drove a 3½ h.p. T.T. Norton down from Scotland for the All-khaki Meeting last August; and ran it against the clock along the railway straight at Brooklands in the teeth of wind and rain. It was started just as it came off the road, untuned, with a 4½ gear, horn, lamps, tools, and Philipson pulley, yet it did 31 seconds for the half-mile. He offers to wallop any twin I can produce up Dashwood as soon as the war is over. Well, I don't know when the war will be over, so I cannot guarantee what machines will adorn my stable when my sportsman is at liberty.

In Winter Kit.

All the winter riders must have gone to the Front; for the other week I covered several hundred miles without meeting a single solo rider, barring one or two local potterers gingerly going brief business rounds on two-strokes. I was a pretty sight—gumboots, oilies, three jackets, two pairs of socks, two pairs of gloves, a scarf, and ear sausages. Halfway round the trip I broke my mudshield, and finished without it. Its absence appeared to make no difference to the temperature of my nether limbs, and I believe the real value of these fittings is that they prevent wet mud from sloshing on to one's leggings. By the way, I don't think I ever suffered before from serious belt slip in the last half of a countershaft drive, but I got it in the neck on this occasion. But the machine in question is so thoughtlessly designed that the countershaft pulley has no bigger diameter than the average direct drive engine pulley. What fools men be! It is plain that one great merit of the combined drive is the facility it affords for a bread-trencher pulley.

A Catch?

Mr. F. G. L. Evans has written challenging me to a twenty-mile speed contest on the road, in which I am to ride "my four-cylinder Henderson" solo, and he a 7 h.p. F.N. with sidecar and three up; he further offers me half-a-mile start. There are two obstacles to my acceptance, one being that I haven't got a four-cylinder Henderson, the other that my identity is purposely kept pseudonymous. I do not know whether there is some catch about this obviously absurd "dare," or whether Mr. Evans happens to know that I personally cannot accept it, and wishes to boast that the Henderson cannot face the F.N.; or whether Mr. Evans is so ignorant of Henderson quality that he expects its engine to seize up at the pace he hopes to set. Possibly some Henderson rider who has a freer hand in such matters will take on Mr. Evans, and convince him that whatever may be the comparative merits of the two four-cylinders, the Henderson can certainly knock spots off any machine ever made in such a ridiculously unequal contest as he proposes. Mr. Evans seems to be a little hurt that I have not yet published a panegyric of the F.N. The explanation is perfectly simple. I cannot purchase a sample of all the machines on the market, and it so happens that I have not had a chance of straddling an F.N. "four" for several years past. However, I am quite ready to take Mr. Evans's word for the excellences of the latest F.N., and I will make a point of sampling its paces at the first opportunity. The Editor has Mr. Evans's address, if any Henderson enthusiast desires to explore his curious challenge. I should suggest a dual venue for the running off, as such scraps are naturally illegal on the open road. Brooklands would afford a chance of showing Mr. Evans's exaggerated partiality up on the straight, and one of the private manufacturer's tracks in the Midlands would prove whether the sidecar outfit is handier round a continuous stream of corners. I doubt whether Mr. Evans would ever catch up a yard of his proffered half-mile start, even on a music hall trick rider's stage "saucer."

SOME NEW SIDECAR ATTACHMENTS.

The sidecar, in spite of its theoretical disadvantages and lopsided appearance, has, in practice, proved itself to be a very satisfactory little vehicle, as well as the most economical passenger machine on the road. When attached to a suitable bicycle it is capable of a speed of 40 m.p.h. or more, and can travel as much as seventy or eighty miles on a single gallon of petrol. What wonder then that, with all its disabilities, it is popular, and likely to remain so. We illustrate below the latest products of some well-known manufacturers of sidecar attachments.

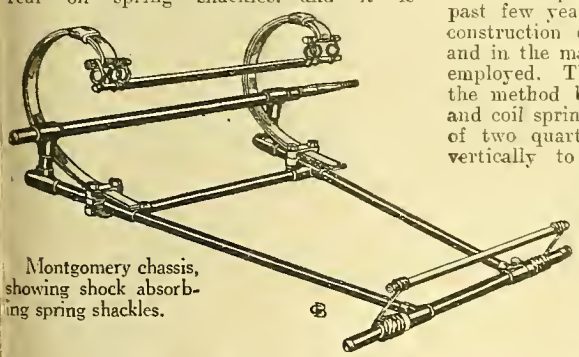
A NEW MONTGOMERY SIDECAR.

FEW sidecar manufacturers have achieved such uniformly good results from their goods as W. Montgomery and Co., of Coventry, who have been making sidecars for thirteen years. The productions of such a firm command interest, and we are glad to be in a position to publish details of a new Montgomery model for 1916, to be known as the Lounge.

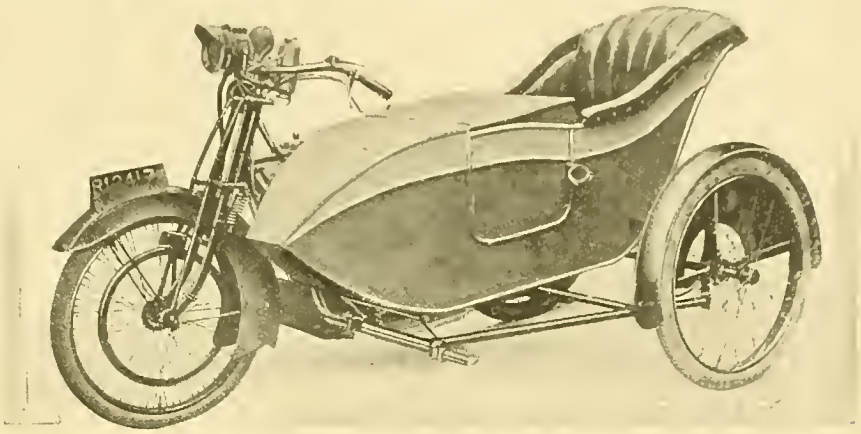
The new model has a substantial coachbuilt body, the feature of which is the high back and sides. Two lockers are provided, one under the toe and the other under the seat. The upholstery is well carried out, and the car, which is extremely roomy, should be very comfortable to ride in.

The chassis will not be altered, as under all conditions it has proved most satisfactory. The two side members are triangulated; this gives great strength, and also allows of the sidecar being attached close up to the motor cycle, the side member being well out of the way of the footrest. It will be noticed that the sidecar is slung at the rear on spring shackles, and it is claimed that these damp the shock. Other commendable points of the Montgomery chassis are its extreme lightness, simplicity, and strength.

Needless to say, Messrs. Montgomery have a complete range of sidecars in addition to the above model.



Montgomery chassis, showing shock absorbing spring shackles.



New design Montgomery sidecar to be known as the "Lounge."

HENDERSON SIDECARS FOR 1916.

THESE sidecars are now made in several different models, though the main features of the chassis remain much the same as those that have proved so satisfactory for the past few years. All tubes used in the construction of the chassis are straight, and in the main frame only four lugs are employed. The springing is quite novel, the method being a combination of leaf and coil springs. The rear springs consist of two quarter-elliptic springs, attached vertically to the rear portion of the chassis in such a way that they can be adjusted to suit the passenger's weight, and the back of the body can also be elevated or lowered to suit the different heights of attachment for various machines. The body is then suspended on coil springs which, at the same time, act as shackles. The body is sprung at the front also on a combination of leaf and coil springs. The attachment clips have been modified, and are now adjustable to any chain stay without alteration.

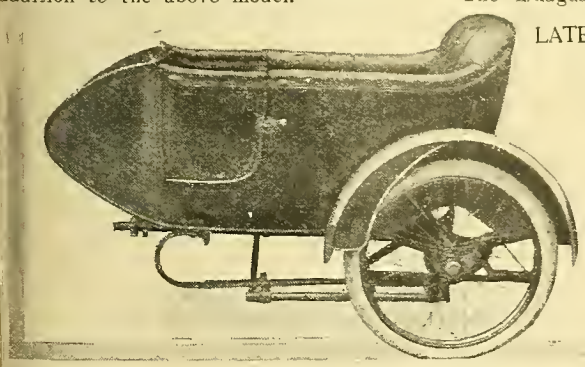
The mudguard is attached by three substantial stays, and is fitted with deep side valances.

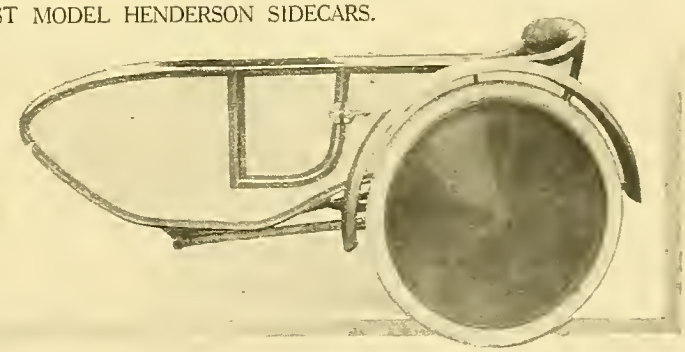
Disc wheels can be supplied with all models. A special model is also made to suit Indian and similar spring frames.

Another new Henderson sidecar, showing quarter elliptic springs placed vertically with the body attached on spiral springs, which act as shackles. The tool locker will be noticed.

A number of different pattern bodies are obtainable coachbuilt, cane, or wicker, with and without lockers.

LATEST MODEL HENDERSON SIDECARS.





The one on the right weighs 48 lb. complete, and with disc wheels is well suited for fast work.

A BATH-CHAIR SIDECAR.

AT the termination of this war a problem will arise to which few people have given any attention, namely, the disabled soldier, who once was an enthusiastic motor cyclist, but now is debarred from this pleasure. For his especial use Messrs. S. A. Newman, Ltd., have designed and built a sidecar unlike all other sidecars, in that it can be transformed into a bath-chair with very little expenditure of time and labour.

The chassis and springing used for this model are exactly similar to the firm's standard model, the body being mounted on long C springs with interposed coil springs at the back, while there is a platform carrier for luggage, and a screen with a fabric cover for the fore end of the car. In detail, however, the design is much altered, as at the forward end of the chassis is mounted a motor cycle head wherein is a pair of small forks holding a solid-tyred wheel, the whole giving a caster action when the sidecar is being pushed as a bath chair. A second wheel with pneumatic tyre is attached to the frame, together with an extra mudguard, both wheel and guard being detachable when a few nuts have been unscrewed, and when detached that part of the frame which acts as the wheel spindle becomes one point of attachment for the motor cycle. Permanently in position is the forward attachment tube, but when the motor cycle is detached this tube can be swivelled out of harm's way. The small caster wheel at the front comes off when one bolt is undone, while there are lugs for the remaining two supporting tubes between the sidecar frame and the motor cycle.

An Adjustable Back.

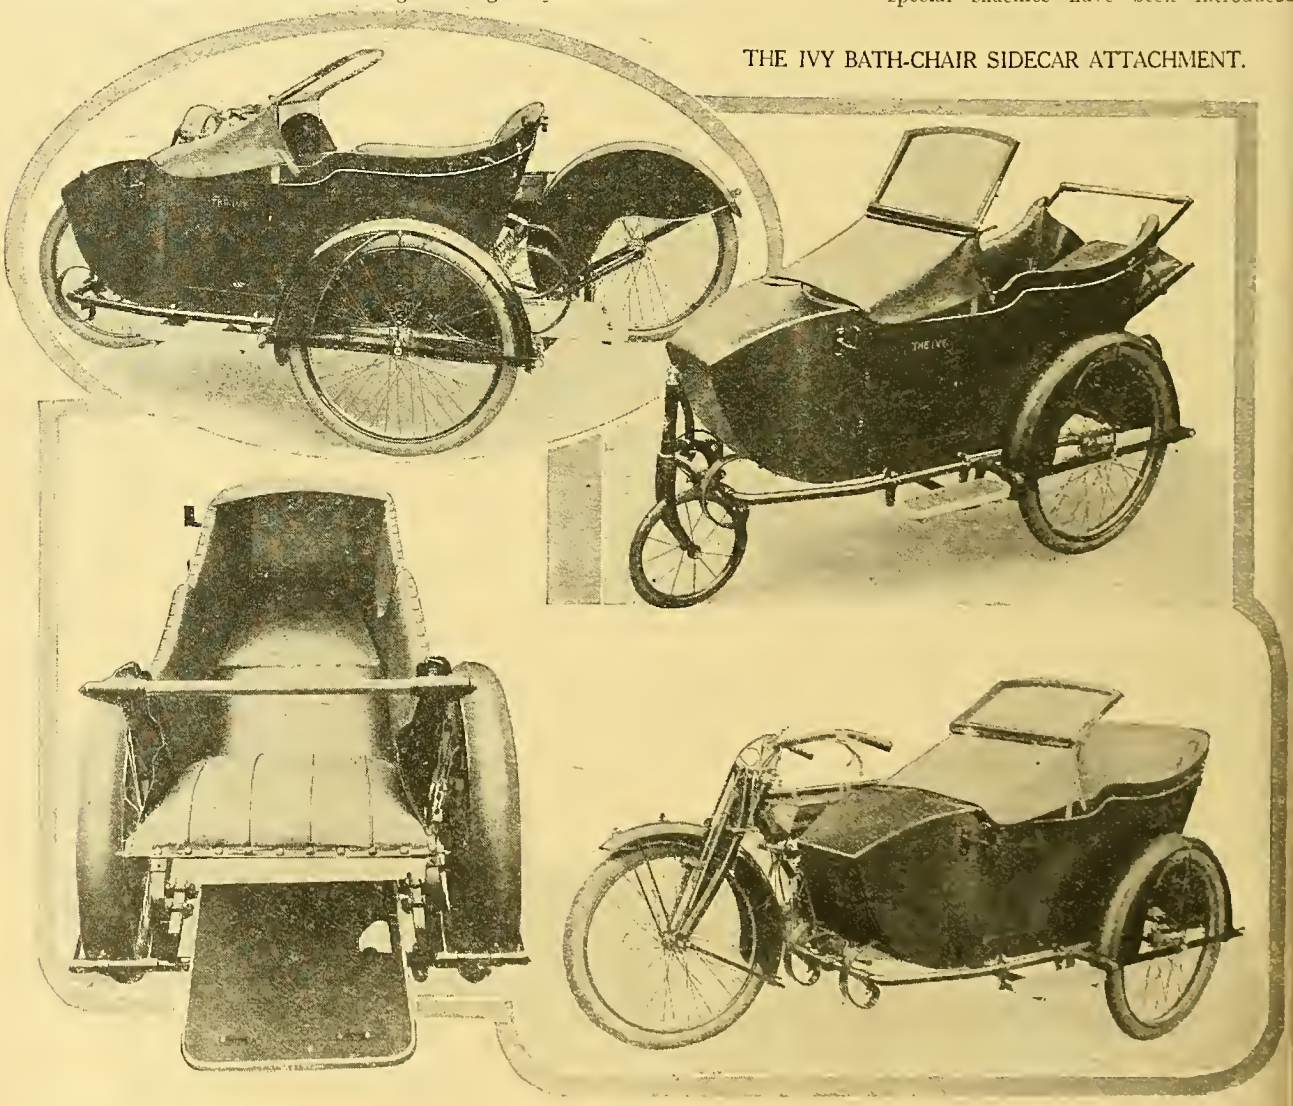
As a patient may not always be in a condition to sit upright, the rear panel can fall over at a large angle, but can be supported by a strap at any point over this angle, thus allowing the occupant of the sidecar to assume a prone position, while the foot space can be raised by fitting a special cushion.

Attached to each side panel is an arm to take the handle by which the machine is pushed, and as the arms are attached by butterfly nuts, both can be removed in a moment. Thus, we have a machine which can be driven as a sidecar, and, if necessary, converted to a bath-chair in a very short time. Obviously, the advantages of this dual purpose machine do not appeal to everyone. Nevertheless, there are many cases where some such arrangement would be an inestimable boon.

SOUND SIDECAR CHASSIS CONSTRUCTION.

THE new Britannic model brought out by J. Harrison and Sons has several interesting details. For instance, the body is slung from a long double C spring having the smaller C at the front, where the spring ends are fastened to a bar running below the body. At the back is the larger C, and special shackles have been introduced

THE IVY BATH-CHAIR SIDECAR ATTACHMENT.



The novel Ivy sidecar, which can be converted into a bath chair by a few simple adjustments. The top right and bottom left hand pictures show how the back is adjustable to give a reclining position for an invalid who is unable to sit upright.

Some New Sidecar Attachments.—

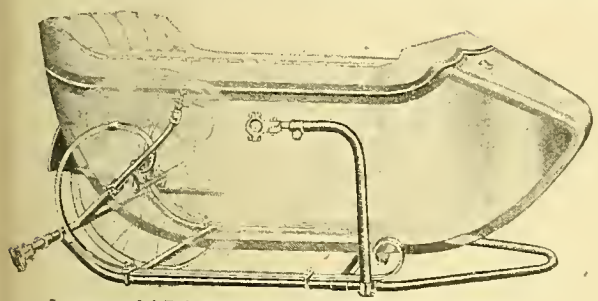
as connecting links between springs and body, thus allowing a more free movement to the body and adding to the rider's comfort. The chassis is triangular in shape, with the base of the horizontal triangle formed by the axle of the sidecar and the apex projecting below the nose of the body. There are two cross tubes, one a specially strengthened tube just in front of the axle, while the other is placed below that point where the body sweeps upwards to the nose.

The sides of the triangle are used as rests whereupon the long double C springs are clipped by two shackles apiece, while the attachment tubes are adjustable in every direction and secured to lugs on the motor cycle in such a manner that the sidecar can be removed with ease, it being necessary to unde one belt only for each of the three attachments.

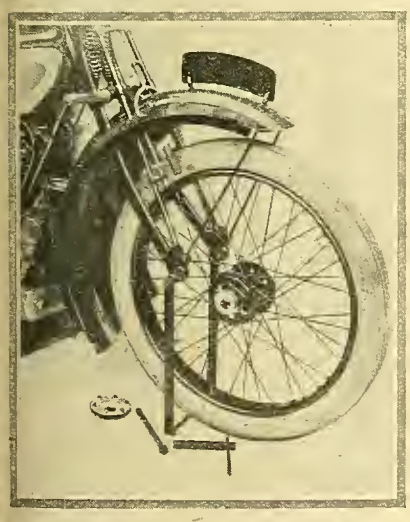
Coachwork Details.

As to the body, this is of the same shape as the 1915 model, has well-padded comfortable upholstery, and a small but neat side door on the off side of the body. A stout mudguard, with a deep extension on the body side, is supported from the axle by three flat steel strips, and should protect the varnish adequately while being a rigid fixing, and with its black enamel forms a pleasing contrast to the body. Standard finish is dark green or grey.

The makers, J. Harrisen and Sons, Ltd., Constitution Hill, Birmingham, have several other models, including a sidecarrier.



Latest model Britannic sidecar showing new design chassis.



The A.J.S. detachable wheel. To remove the front wheel it is only necessary to unscrew the centre pin (shown on the floor in the illustration) and withdraw it with a distance piece. To the left is the dust cap for protecting the driving face of hub when used as the front wheel.

INDEPENDENT OF RAILWAYS. Most motor cycle manufacturing firms use sidecarriers for quick delivery, and our illustration shows a couple of B.S.A.'s, which are continually running between the manufacturers' Redditch and Small Heath works. The first one, it will be noticed, is fitted with a sidecar brake and a dynamo lighting set.

THE INSTITUTION OF AUTOMOBILE ENGINEERS.

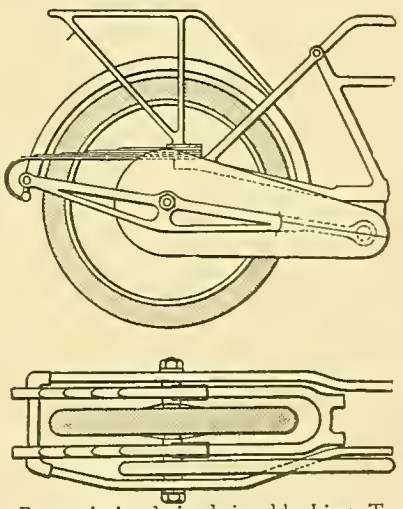
The next general meeting of the Institution of Automobile Engineers will be held on December 15th (not December 8th as previously announced) in the Hall of the Surveyors' Institution, 12, Great George Street, Westminster, S.W., at 8 p.m., when Mr. F. W. Lanchester, M.Inst.C.E., will read a paper entitled "The Cylinder Cooling of Internal Combustion Engines, more especially as concerning Automobile Practice."

FURTHER LIGHTING REGULATIONS.

The Commissioner of Police states that from December 1st all vehicles and bicycles in London must after dark carry a back red light, as well as a white light in front. For horse-drawn vehicles it is sufficient if lamps are carried on each side at the front, showing white lights forward and red lights behind. If only one lamp is carried in front (on the off side) there must be a separate red lamp on the off side at the back. This is indeed a sensible regulation, and we only wish we were at liberty to say that it was to be in force over the whole country, but we should like to see a rear light at the back of the cart, or load, always compulsory.

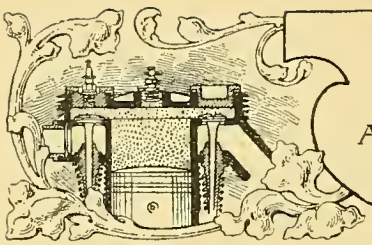
MORE REAR SPRINGING.

STILL another spring frame has been brought to our notice; it is the design of Lieut. T. S. Vaughan Phillips, R.N. A moving chain stay is pivoted at the driving centre of the countershaft by means of a large ball bearing. This chain stay is carried right round the back wheel to ensure rigidity; it is also strengthened in girder form. The springs, which are leaf springs, are secured to a casting formed on the end of a rear member of the frame, their extremities being attached by means of shackles to the end of the moving chain stays.



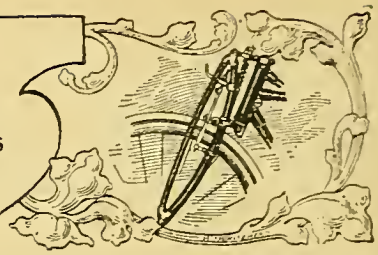
Rear springing device designed by Lieut. T. S. V. Phillips, R.N., described on this page.

It will be seen that the only unsprung weight is the rear wheel, stays, and mudguard, the carrier being attached to the rigid portion of the frame. It is suggested to carry the rear chain case on the right-hand of the machine and secure it to the moving member, and, obviously, there will be no variation in the distance between the chain centres.



Aluminium Alloy Pistons.

A Metal Giving Several Advantages besides Light Weight



LATELY there has been a great deal said on the subject of employing light aluminium alloys in the construction of high-speed highly efficient internal combustion engines as used in car, aero, and motor cycle work. One of the most striking novelties in this respect is its introduction as a metal for pistons. When used for this purpose the selection of the metals and the proportions in which they form the alloy is of the highest importance, and makes just the difference between success and failure. Pure aluminium is quite out of the question for several reasons, the chief being its brittleness, which prevents it standing up to the strain imposed on it at the high temperatures under which a piston has to work, especially in an air-cooled engine. Beside this the melting point, friction, wearing qualities, expansion, etc., are all points which have to be carefully considered, and in most of which pure aluminium proves unsuitable. There are a number of different aluminium alloys which have proved quite satisfactory, though it is extremely difficult to make a satisfactory job of casting these alloys, and each maker specialising in this work has some secret process.

Light Weight the Original Object.

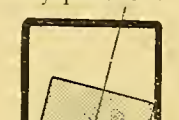
The original object of using aluminium or aluminium alloys for pistons was that owing to its apparent lightness, combined with the fact that its material strength was very little under that of cast iron, bulk for bulk, the fitting of these pistons would save a considerable amount of weight in the reciprocating parts, a point much sought after by designers of high speed motors. It is still the general belief that lightness is the sole object of this type of piston. It was, however, found after much experimenting that these alloy pistons proved to be little lighter, if any, than the light steel pistons used on racing engines. This extra weight was due to the fact that owing to the greater expansion and softer nature of the aluminium alloy it became necessary to fit a considerably larger gudgeon pin in order to overcome the tendency of the pin working loose, the result being that the total weight was very nearly that of a steel piston, and it would appear that there was little left in favour of the light alloy piston. However, during these experiments it was gradually discovered that there were other and far greater advantages in the alloy piston than the mere saving of weight, which would justify the use of aluminium even if the weight had to be exactly the same as that of either cast iron or steel pistons.

Reduction of Carbon Deposit.

Perhaps one of the most noteworthy of these advantages is the fact that aluminium is one of the finest conductors of heat, and is roughly three times better in this respect than either cast iron or steel. It will, therefore, be seen that the heat generated by the explosions on the piston head is very quickly carried off to the piston skirt, where it can be more rapidly transmitted to the cylinder walls owing to the greater amount of surface in contact. For this reason the piston will never reach such a high temperature, with the result that the carbonisation of oil on the top of the piston is very greatly diminished, and, in fact, in the case of water-cooled engines with these pistons, carbon on the piston top is almost non-existent. Provided a piston of sufficient thickness is used, this point might prove to be of the very greatest advantage in the construction of lightweight two-strokes, where one of the greatest troubles is the rapid carbonisation of the piston head and top piston ring, which is apparently due almost entirely to the extra amount of heat generated in this type of engine, and the inability of the cast iron piston to carry the excess of heat off quickly enough. In order to obtain to the full the advantage of this rapid cooling it is even advisable to make the piston thicker than is really necessary for the sake of strength, for the thicker the material the quicker the heat can be carried away, on the principle that a thick cable is capable of carrying, in the same time, more electricity at the same pressure, than a thin one. This point is, of course, more important when the engine is air-cooled, and where the effect of carbon deposit is more noticeable.

Little Tendency to Seize.

Another point very much in favour of aluminium alloy pistons is that the liability to seize is very small, and even if they do seize the consequences are, as a rule, not serious. Should the pistons be too tightly fitted they will lap themselves in without any evil effect being noticed. These conditions are due to the softer nature of the metal which enables the high parts to be smoothed down easily in running without the usual liability of seizure. Here, again, the greater conductivity of the metal enables the extra heat caused by the friction to be conducted rapidly away, thus also reducing the liability to seize.



F.g. 1.

How the Aluminium Wears.

The question as to whether the two metals, the cast iron of the cylinder and aluminium alloy of the piston, work together satisfactorily is a matter to be considered, and the best illustration in its favour is the satisfactory results obtained by the use of white metal for bearing surfaces where very similar conditions prevail, viz., a soft and a hard metal working together. It is a well-known fact that in most cases white metal bearings give far superior results to those obtained with, say, even phosphor bronze, and here

Aluminium Alloy Pistons. —

again the tendency to seize is small, while in the event of such an accident happening the damage resulting is also considerably less than when harder metals are used.

A point which would appear to be a great drawback to the use of aluminium alloy pistons is the fact that the expansion of this metal upon being heated is very considerable, with the result that in order to obtain satisfactory running when the engine is hot, a very much greater clearance between cylinder and piston has to be given, so that when starting from cold the piston is inclined to tilt, which, of course, causes a slight rattle. However, after running a short while (a few seconds in the case of an air-cooled engine), the piston becomes warm and expands, after which it will run as sweetly as a piston made of any other material. This trouble may be greatly reduced by making the piston longer in the skirt than is usual; as will be seen from the exaggerated sketches (figs. 1 and 2), with the long piston the tilting effect is greatly reduced. The longer piston also has the advantage of being able to conduct more heat as previously mentioned. Another advantage of having the piston extra long is that, if it is of sufficient length to overlap the stroke travel, the oil is not able to work past the rings so easily, and this condition assists in reducing the carbonisation caused by burnt oil.

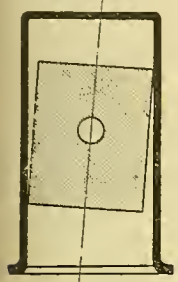


Fig. 2.

A Satisfactory Gudgeon Pin Fixing.

The method of securing the gudgeon pin illustrated in fig. 3 is a method used largely in connection with American engines, but is particularly suitable for use with aluminium pistons. The pin is secured in the small end of the connecting rod by means of a split small end and clamping bolt. It works in the bosses of the piston, which are bushed with phosphor bronze forced into place under pressure. This method of fixing overcomes the necessity of the larger gudgeon pin previously mentioned, as the bronze expands much more evenly with the aluminium than steel does. It is, therefore, not necessary to make the gudgeon pin so large, and for that reason weight is reduced.

Finally, although apparently lightness was the primary object for attempting to discover an aluminium alloy suitable for making pistons, it would seem that advantages have been brought to light in favour of these metals that are of even greater value than the saving of weight. As a matter of fact, pistons which will work quite satisfactorily for a short time can be made of steel much lighter than at present can be produced in aluminium, but the fact that they are of so fragile a nature renders them, for any purpose other than a short sprint race, quite unsatisfactory. In the case of aluminium alloys, although the weight may be rather more than the very lightest workable steel pistons, they are considerably lighter, strength for strength, than the lightest cast iron pistons. The fact that greater bulk can be employed for the same weight renders the alloy pistons more suitable for all-round purposes than the light steel ones, and, again, the fact that the alloys work better in conjunction with the cast iron of the cylinder is another point greatly in their favour. There is little doubt but that in the future we may expect great things from alloy pistons in connection with motor cycle engine construction.

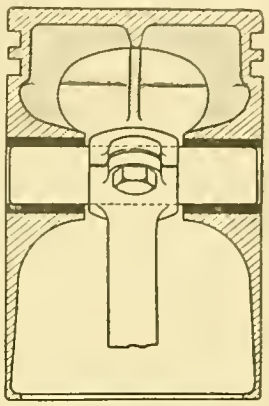

Fig. 3.

Opening of the New Zealand Competition Programme.

SUMMER is now in full swing on the other side of the Equator, and the last communication, published below, from our Auckland (N.Z.) correspondent, shows that the various clubs in that part of the world are recommencing outdoor activities.

We do not think that some New Zealanders can realise the effective manner in which the British Navy has stopped the so-called submarine blockade of the Germans. We are led to make this remark by reason of the fact that our Christchurch correspondent goes to the trouble of sending duplicate reports by following mail boats in case the first one should be torpedoed

Latest club activities are reported in the following paragraphs:

Napier Motor Cycle Club.

The opening run of this club was held on September 4th, when a large number of members journeyed to Hastings, where they were entertained at afternoon tea by the club captain, Mr. J. Taylor. The annual reliability trial and sidecar trial will have been held by now.

Pioneer Club, Christchurch.

During the winter months the Pioneer Club has held no competitions, but the racing season was to be opened a month ago with beach races. An opening run was held to Waihora Park on September 26th, when many members had an enjoyable outing.

Wellington Motor Cycling Club.

The above club held a fast hill-climb at Wellington on September 25th, the entries being fair. The hill selected was 500 yards long, steep, and rejoiced in four sharp corners. The climb was won by R. Keene, 3½ h.p. Triumph.

Otago Motor Club.

The annual meeting of the Otago Motor Club was held at Dunedin on September 18th, when there was a large attendance. Many important affairs were discussed, and it was decided to continue putting before local bodies the question of better roads. It was stated that the club had collected sums of money for the different patriotic funds, and had paid over £300 towards providing motor ambulances for the New Zealand Expeditionary Forces.

OVER THE SNOW-BOUND PENNINES

WITH THE DESPATCH RIDERS.

The five despatch riders on the crest of the Pennines at Dent Head. From left to right—Troopers W. J. Skurr, J. T. Frankland, H. L. Roberts, T. Walker, and G. Wightman.

By GEORGE D. ABRAHAM,
Author of "Motor Ways in Lakeland," "The Complete Mountaineer," "Mountain Adventures at Home and Abroad," etc.

"COME over for a sporting day with the 'despatchers' on the Pennines!" Thus, on a dull November morning of cheerless promise came the welcome message from Kendal. However, fair weather or foul, it was impossible to refuse the privileged invitation, for George Braithwaite, the well-known competition rider of that town, had spent weeks organising the training of the despatch riders, and now was the chance to see the results. Kendal, as the eastern gateway of Lakeland, had afforded a starting point for many splendid runs, and aided by keen instruction from Lieut. Parker and Corporal Wraighte, the despatch riders had been trained under conditions strikingly similar to those at the Front. This northern mountain land had afforded ample practice in following a fixed but devious route in quickest time over the roughest and most trying of roads. These north country methods may lead to further developments, for the authorities are learning that flat country riders are at a disadvantage amongst mountain regions where campaigning is now in progress.

Teams and the Route.

It was pleasing to note the workmanlike steadiness of the men who were sent forth at two-minute intervals from the Kendal Drill Hall on a characteristic competition route. All were as keen as the early morning air which swept down the Valley of the Kent and from the fog-hidden Pennine heights. There were three teams of riders. The Duke of Lancaster's Own Yeomanry were represented by Lance-corporal Wightman and Troopers Fletcher, Kendall, Biddle, and Sydbury. For the Lancashire Hussars there started Corporal Wiggalle with Troopers Watkins, Roberts, Lind, Eccleston, Seddon, and Viall, whilst for the Westmorland and Cumberland Yeomanry Lieut. Grierson, Troopers Watson, Frankland, Rigg, Skurr, and Walker were sent first away. The machines were mostly Douglases and B.S.A.'s, but it was noticed that Trooper J. Kendall rode the Norton on which he recently performed so successfully at Brooklands.

The route lay over the Greyhound Hill to Sedbergh, thence to Dent and up the long Dent Valley to Dent Head Hill, by which Newby Head and Hawes would be reached. Buttertubs Pass gave access to Keld, Tan Hill, and Bowes, whence the homeward way was planned by Tebay. Probably no finer test could be proposed, but alas! man proposes and the weather disposes.

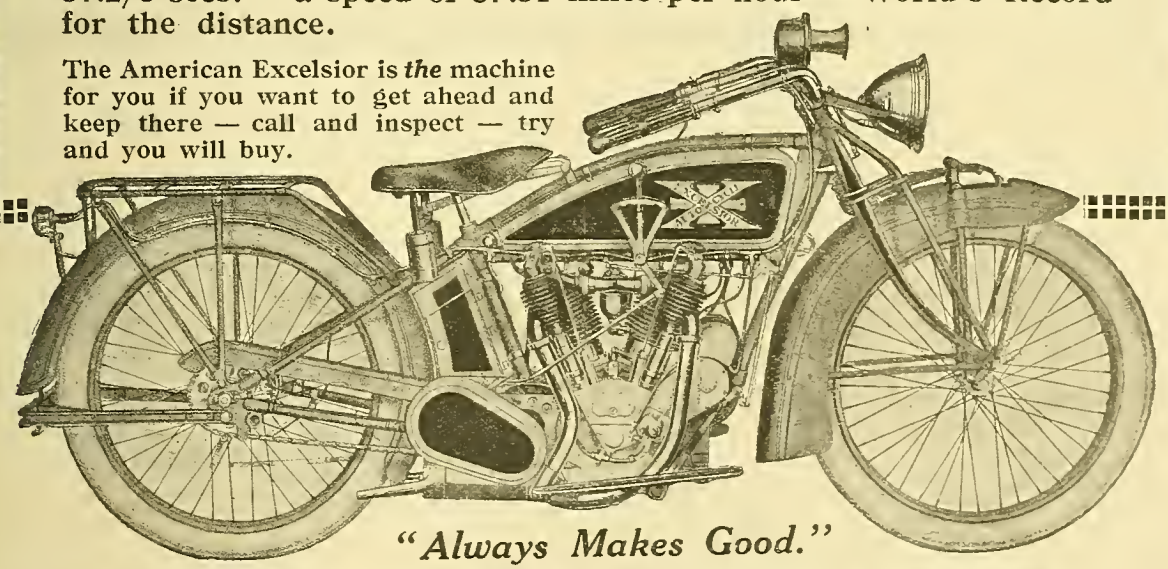
The writer followed the cheerful crowd of riders on a standard 6 h.p. A.J.S. sidecar outfit driven by Mr.

The
HOLDER
of the
WORLD'S 300 Miles Record

The AMERICAN EXCELSIOR
America's Best Auto-Cycle

— the first Motor Bike to attain a speed of 100 miles an hour — has smashed another world's record. In a 300 mile race in Chicago on September 12th, "The Good Old X" finished first in 3 hrs. 29 mins. 57.2/5 secs. — a speed of 87.51 miles per hour — World's Record for the distance.

The American Excelsior is *the* machine for you if you want to get ahead and keep there — call and inspect — try and you will buy.



"Always Makes Good."

Prices: STANDARD MODEL. 7 h.p., 3-speed countershaft gear, multiple disc clutch, chain drive, kick starter, mechanical lubrication **£80**

MODELE DE LUXE, as illustrated, complete with Dixie combination lighting and ignition, powerful head and tail lamps, electric horn, and speedometer **£90**

M.C. 100

Over the Snowbound Pennines with the Despatch Riders.— Harry Whinnerah, whose sporting performances, especially with the despatch riders, have become famous in the North. For a one-armed driver to have driven a standard machine over 16,000 miles of difficult country since July is remarkable. At any rate, in the writer's mind, that day on the Pennines settled the recently much-discussed question—should a one-armed motorist drive?—most effectually.

Soon the steep gradients of the Greyhound lifted us above the morning mists which hung over Kendal. It was a perfect winter's morning. Dry, clean roads, even near the 800 foot level, showed little signs of the icy blizzard that had swept over the heights only two days previously. Close to the crest of the hill there was a glorious backward prospect over a sea of snow-tipped mountains, with the Lakeland heights o'ertopping all. But two riders were quite oblivious to the wonderful scene. They were more concerned with the wonders of the American magnetos which, as it happened, were fitted to their faltering engines. They were not the only sufferers on that account, and it is pleasing to learn that this defect, the only one revealed during the day's run, is likely to be remedied by fitting an English pattern to the despatch riders' mounts.

Climbing Dent Head Hill—a snowy, slippery gradient.

Dentdale.

Then there was a magnificent run over the uplands, and thence, after a descent of Black Horse Brow, an excellent test-hill, Sedbergh was reached. This much-maligned section of the route was found in excellent surface condition. A keen crowd of boys from the famous old school gave cheerful greetings as we swung off to the right and on towards Dentdale. 'Midst showers of late autumn leaves we threaded the curly intricacies and rushed the gravelly gradients of the dale. Dent village, with its narrow paved lanes and timbered dwellings so reminiscent of many an Alpine hamlet, would have well repaid a long halt. There was just time to notice the country smells and a curious village fountain gushing forth from a huge rock monolith, and out we dashed again into the narrowing dale with snowy heights creeping nearer and nearer ahead.

Up into the Snow.

Away up on the right there were two splendid hills of much merit and interest. The former of these, Flinter's Hill, seemed to spring straight above the village of Dent, and local repute avers that no motor vehicle has ever climbed it. The other hill, Deepdale Head, curled up to the snowy skyline farther to the south-west, and this had already yielded to a former attack by the despatch riders. It was the sight of the snowy scarp, with the alabaster crest of Whernside towering two thousand feet aloft, that first roused serious misgivings regarding the possibility of the day's run. Moreover, as our road climbed gradually up into the narrow dale between Longshaw Pike and Wold Fell, the splendid dry road-surface changed gradually to an icy slope and eventually we were ploughing through the thickening snow on middle gear. The slower progress did, however, allow time to note the prettiness of the rocky glen alongside, where the turbulent Dee leapt down from ledge to ledge with scarce a boulder to break its dash over the curious limestone slabs.

Battling with the Snow.

At last the road led straight up the mountain front. On low gear we dashed round the first turn and into a mixed mass of despatch riders and followers. So serious was the block and so solemn their mien that there might have been a German machine gun raking them round the corner. The noise was certainly there, for one machine with open exhaust was struggling on the steep gradient, its back wheel spinning helplessly on the snowy incline.

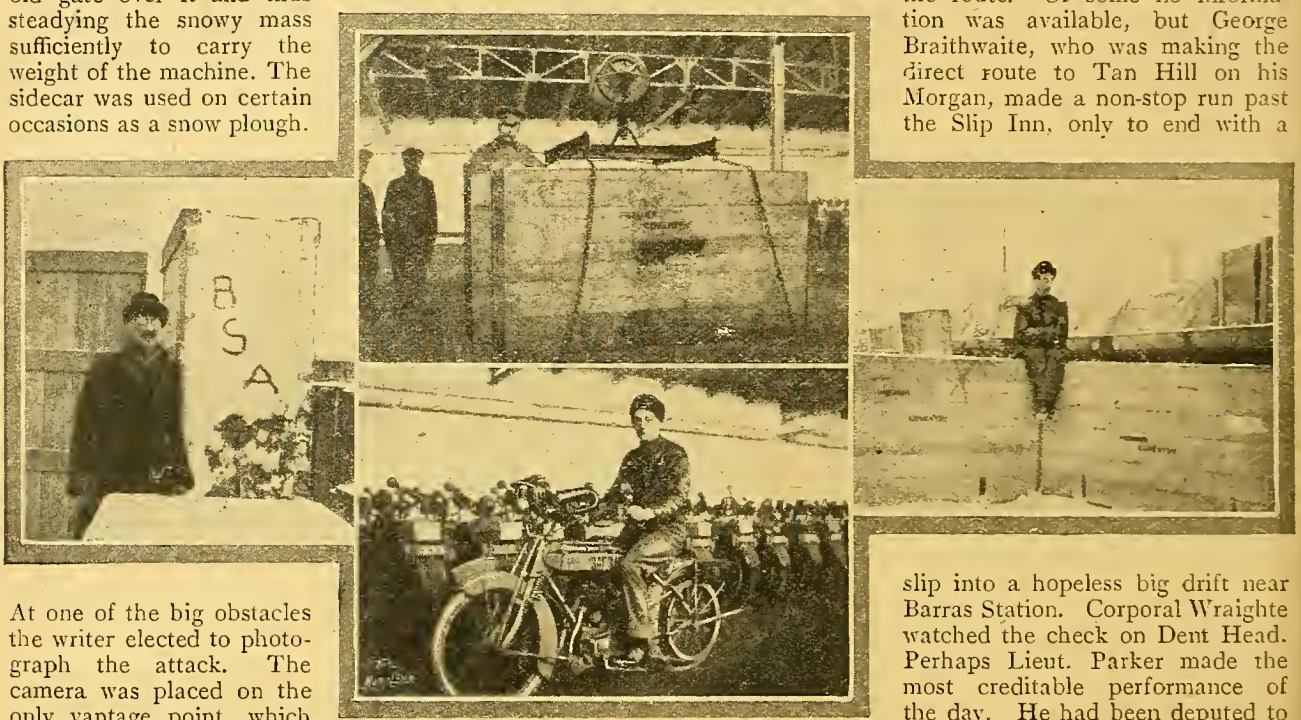
Winter reigned here with a vengeance, and this first part of Dent Hill marked the end of several riders' efforts. About a dozen enthusiasts managed to mount halfway up the mile-long gradient, which, in normal condition, would have been nothing more than a stiff climb. There were many adventures here. More than one over-dashing rider bit the dust, or rather the snow, for anything but slow speed seemed prone to produce severe side-slip. The superiority of the chain-driven machines on this class of work was very noticeable. The B.S.A.'s were specially successful. Eventually seven machines reached the top of Dent Head Hill, but only one entirely under its own power. The last of them arrived minus the tread of the rear cover, and with the engine hot enough to burn a large hole in the rider's overcoat. It was amusing to stand upon the snowy crest and note that the first sign of an up-coming machine was the smell, and this long before sight or sound revealed any living thing.

Thanks to help from Lieut. Grierson, the A.J.S. sidecar reached the summit. Then we followed five of the despatch riders, Troopers J. T. Frankland, H. L. Roberts, W. J. Skurr, G. Wightman, and T. Walker, steadily upwards over the white wastes to

Over the Snowbound Pennines with the Despatch Riders.—

near the 1,600 feet level. At this point there came more than an hour's struggle with many deep drifts. All ideas of competitive riding had long ago vanished; all efforts were concentrated on helping each other through and over the difficulties. Sometimes there were spaces between the drifts where the storm had swept the road surface comparatively clear. From these vantage points the despatch riders dashed wildly at the opposing drifts, gradually forcing a way through or over. One solid mass about five feet high was surmounted by placing an old gate over it and thus steadying the snowy mass sufficiently to carry the weight of the machine. The sidecar was used on certain occasions as a snow plough.

BRITISH MOTOR CYCLES FOR THE RUSSIAN GOVERNMENT.



Large consignments of British-built motor cycles, such as B.S.A., Sunbeam, Rudge, P. and M., and Premier, have been despatched to Russia for our Russian Allies. The photographs reproduced above were taken at the port of disembarkment, and show British representatives of the firms in question supervising delivery of the machines in boxes. The B.S.A. man evidently does not believe in losing an opportunity of advertising his machines. The row on the right are 3½ h.p. Premiers.

At one of the big obstacles the writer elected to photograph the attack. The camera was placed on the only vantage point, which was the middle of the road beyond the drift, and directly in the track of the oncoming "'bus." With two uproarious despatch riders aboard, they crashed madly into the white, soft mass, while the writer "pressed the button" and disappeared into the snowdrift on the roadside almost simultaneously. However, "all's well that ends well," as one of the accompanying photographs show.

"The Law is a Hass."

Then, eventually, every obstacle on these Pennine heights was vanquished, and we sped skiddingly onwards and downwards to the only sign of civilisation in these mountain wilds. This was Newby Head Inn, 1,450 feet above sea level, and one of the many highest inhabited houses in England. Wet through, weary, and much the worse for wear, we at last hoped for refreshment. Alas! it was past two o'clock, and the men who serve their country could not be served. The landlord was obdurate until the civilian of the party arrived and found that he could "do his bit" for once, for it seemed that half-past two was the civilian closing time. On such an occasion this seemed a strange anomaly.

The waning afternoon light showed that further continuance of the competition would be useless. Thus a way was made to Hawes, and on roads entirely free from snow Kendal was reached as the first moonlight gleam spread over the icy crests of the distant Pennines. It was interesting and amusing to learn what had become of the various officials who had been appointed to observe and check upon some sections of the route. Of some no information was available, but George Braithwaite, who was making the direct route to Tan Hill on his Morgan, made a non-stop run past the Slip Inn, only to end with a slip into a hopeless big drift near Barras Station. Corporal Wraighte watched the check on Dent Head. Perhaps Lieut. Parker made the most creditable performance of the day. He had been deputed to check on Buttertubs Pass, and he actually succeeded in climbing the snowy heights. No competitors disturbed his chill vigil, and the kind help he gave the flockmasters in the rescue of their sheep from the great drifts was much appreciated. In the expressive official words of the despatch service, the competition was pronounced a "wash-out," and certainly the snowy Pennines had wiped us out completely. They had had the best of the argument that day. Yet ere long we hope to renew the battle and ride to victory with the despatch riders of the North, than whom no finer sportsmen can be found, though one wander the wide world o'er.

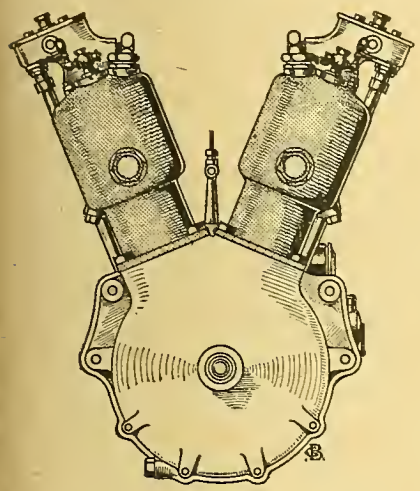
Last month complaints were received by the Automobile Association from members regarding a cross-road sign in the West of England, which has for several years been fixed right on the cross-roads, instead of some distance back. The Association's local manager brought this matter before the notice of the authorities, and the sign will be refixed in a more suitable position.

NEW MODELS

· MANUFACTURERS' PROGRAMMES FOR 1916 ·

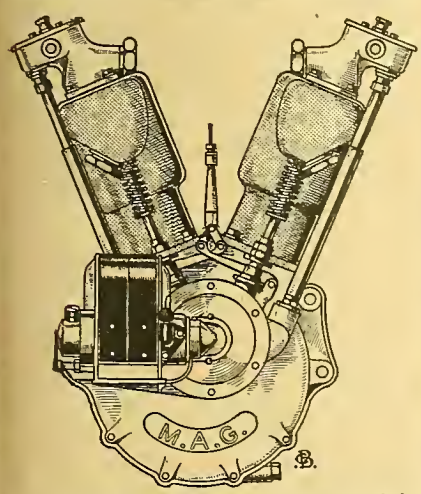
M.A.G. WATER-COOLED ENGINE.

THE accompanying line drawing shows the 8 h.p. twin-cylinder water-cooled M.A.G. engine, the bore and stroke of which are 82 × 103.5 mm. respectively (1,093 c.c.),



M.A.G. twin-cylinder (45°) water-cooled engine.

which is now being supplied to the Morgan Motor Co. This engine closely follows the excellent practice embodied in the 6 and 8 h.p. air-cooled models, and differs only in the fact that it is provided with water-cooled cylinders, that the magneto is carried on a special platform in front, and is bevel driven, and that both exhaust ports face outwards, the last two features being specially introduced for the benefit of the Morgan Motor Co. It will be noticed that the engine preserves the well-known M.A.G. features, such as overhead mechanically operated inlet valves, the controlling mechanism of which is entirely enclosed in a dustproof casing, and works continuously in oil.



Timing side of M.A.G. water-cooled engine, showing position of magneto and overhead inlet valves.

NEW HUDSON LIGHT-WEIGHTS.

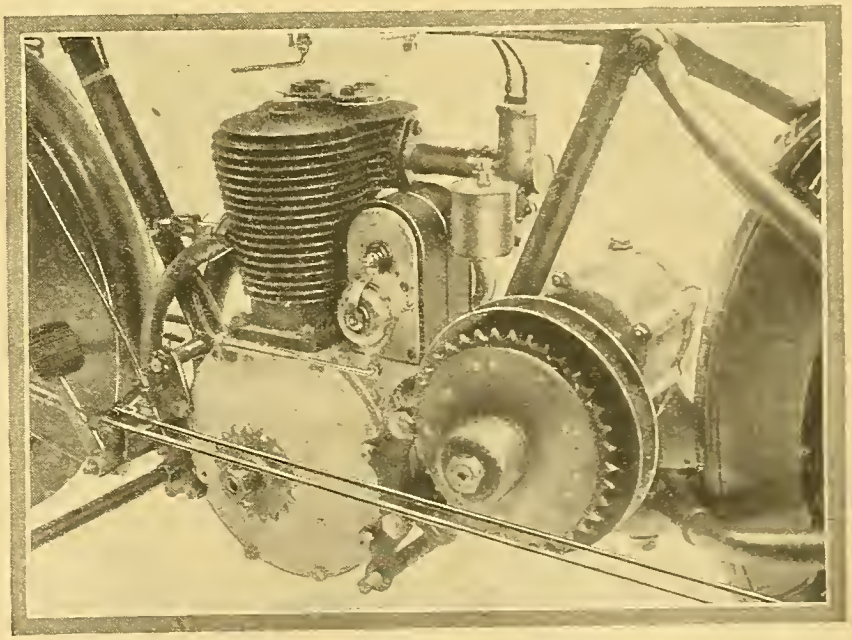
SUPPLEMENTING the particulars of the 1916 New Hudsons given in our last issue, it may be mentioned that there will be two editions of the 2½ h.p. two-stroke lightweight model. They differ but slightly as regards details, and one may be regarded as a de luxe model, whereas the other is built within a certain price limit. Although this means that the de luxe model priced at £42 is fitted with all the luxuries which go to make modern motor cycling so enjoyable, yet there is nothing essential lacking either of material or mechanism in the £38 model.

As an instance of the detail difference between the machines, one has hand pump lubrication, the other hand pump with a visible drip feed. Moreover, there is a slight, but noticeable, difference between the external finish of the two models. As before, the cylinders are heavily ribbed, the ribs flattening to allow the plug to be screwed into position with ease, while the compression release, situated in the cylinder crown, discharges through a long pipe, and will have the extension tube to the chain case.

The exhaust pipe is curved gradually until it joins the silencer slung below the magneto platform, the down tube being forked to allow the exhaust pipe to curve straight away from the cylinder. There is a B. and B. carburetter, while lubrication is effected by feeding oil to the crankshaft main bearing, then allowing the escaping oil from this bearing to be caught in a ring and delivered to the crank pin through drilled passages, thus lubricating the big end from within and at pressure due to centrifugal force.

Novel Gudgeon Pin Fixing.

A copper tube is placed within the hollow tapered gudgeon pin, and the projecting ends of this tube are riveted over in recesses machined in the piston, thus



Power unit of the 1916 model 3½ h.p. single-cylinder Premier. The enclosed driving chain from crank case to countershaft gear box was removed when the photograph was taken. The auxiliary exhaust port and latest design cylinder will be noted.

New Models.—

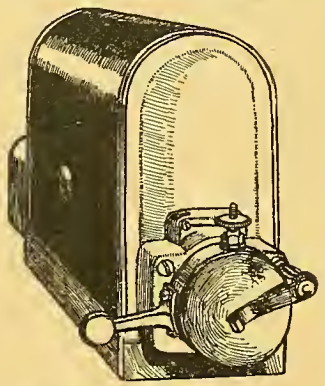
the taper pin, being a driving fit, cannot move round while the tube ends effectually stop endwise motion. This year the chain case between the flywheel and crank case is complete and holds sufficient oil to keep the chain lubricated, further supplies of lubricant coming from the compression release tube. On the gear box the oiler used last year now is replaced by a square-headed plug in a more accessible position, but the box itself is unaltered.

As to prices, the "single" is listed at £65, or with sidecar at £78 10s.; while the big twin is £75 12s. as a solo and £92 8s. with the sidecar.

THE THOMSON-BENNETT MAGNETOS.

Features of a British-made Instrument.

FOR 1916 the energies of Messrs. Thomson-Bennett, Ltd., are centred on production, as, owing to the tremendous demand for motor cycle magnetos at the present moment, it is practically impossible to think of redesigning, or of bringing out a model with any great alterations. The 1915 machines have, however, been altered in a few respects, and now are much improved in appearance since die castings took the place of sand castings for the end plates. Five types are manufactured, three being for lightweight, and two for heavyweight machines.



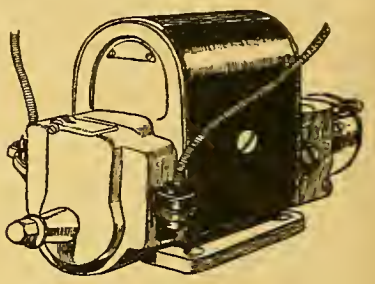
The Thomson-Bennett magneto for single-cylinder machines. It is known as the type A.C. 1.

We take as an example the A.C. 1 single-cylinder magneto, for, except in detail, it is exactly the same as the other machines, as the end plate holding the contact maker has been so designed that either one or two high-tension collector brushes can be fitted. The contact maker is remarkable for the extremely solid rocking arm, this being quite three times the size of that usually employed, while the fibre bush on which this arm rocks is larger, and therefore gives greater bearing surface than hitherto. We understand that certain minor alterations may be carried out to this portion of the machine as soon as the pressure of work allows of redesigning, but these alterations in no way affect the running of the machine and are refinements, not corrections of previous trouble. The contact maker is secured as usual by a taper and a small key, cast as part of the contact maker, the whole being held rigidly in position by a central hexagon-headed screw. Behind the contact maker is a carbon brush, the holder for which is riveted on to the contact maker disc. At a later date this may be altered, and the brush holder will be a solid part cast with the contact maker itself, while the brush may be of larger diameter and held up to its work by a spiral coil spring. The H-shaped armature has at one end what may be best described as a distributer, in place of the collector ring more often employed. In most magnetos there is at the high-tension brush end of the armature a vulcanite or composition double ring, in shape very like a motor cycle pulley. At the bottom of the groove of this ring is a strip of brass connected to the high-tension winding of the armature, and the carbon brush is held down against the ring by a coil spring, thus collecting the current and delivering it to the plug as the disc revolves.

Thoroughly Waterproof.

The Thomson-Bennett ring has some interesting details of design. In the first place, there is no continuous brass ring round the bottom of the groove, but a single small strip which registers with the collector brush at the moment that the current is required for the plug, while in the two cylinder machines it registers in turn with each of the brushes fitted on opposite sides of the end plate. High-tension current has to be insulated very thoroughly, else it will short to earth and not travel along the high-tension wire. Therefore, the greatest care has to be taken with the distributer disc, as at the slightest pretext the current will creep along the "flanges" of the distributer and short on to the casing of the magneto. To overcome this two grooves are cut concentric with the edge of the disc, and as these grooves make the surface of the flange much greater the current is forced to do more work before it can creep along the face of the flange, and this, therefore, makes it more difficult for shorting to occur. Ball bearings are employed for the armature, which bearings are lubricated through small troughs as usual, while there are holes drilled below the bearings to drain off an excess quantity of oil, because should any oil creep along to the armature during the time that the machinery is stationary it would soak through the insulation and cause internal shorting. Those people who have had occasion to inspect the armature of so-called "waterproof" magnetos probably know that it is usual to find a quantity of dirt within the machine itself, and that this dirt is a result of the exposed position of the magneto on motor cycles. To make the instrument really waterproof, Messrs. Thomson-Bennett, Ltd., have one field magnet only, not two or four magnets as is more usual. Thus, there is no gap in the centre of the machine between the two magnets.

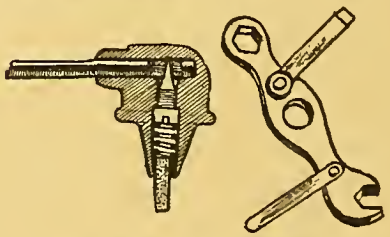
Again, both ends of the magnets are closed by die cast aluminium plates, and these plates are provided with felt washers pressing hard against the ends of the magnets and making it impossible for wet or dirt to find an entry at this point. As the contact maker has its cover, while the brush holders fit down tight upon cone seatings, there is very little likelihood of any foreign matter entering the machine at all.



The A.M. V-type Thomson-Bennett magneto for 60° V engines.

The brush holder is held down on its cone seating by a double flat spring. As the small screw which holds the high-tension wire in place is awkwardly placed for that type of screwdriver likely to be found in a motor cycle kit, the contact maker spanner provided with the machine is fitted with a small screwdriver as well as the gap gauge. This screwdriver can be seen just above the central hole of the spanner in the sketch.

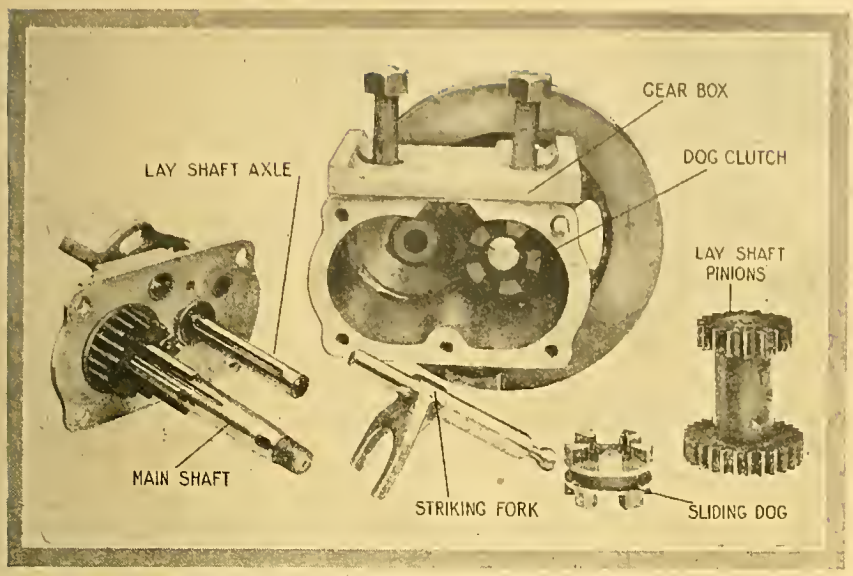
The A.C. 2 machine is similar to the A.C. 1, but, of course, slightly altered for a two-cylinder machine, while the A.M. 1 is a lightweight instrument for single-cylinder machines, and a replica of the A.C. 1 on a smaller scale. The A.M. 2 is a small scale model for horizontally opposed cylinder engines, while the A.M.V is for sixty degree engines and is also a lightweight model. Partly owing to the single magnet, and as a result of the improved die castings, the new machine has a very serviceable and neat appearance, while the fact that the output is very large, and yet insufficient for the orders in hand, is in itself a testimonial to the reliability of the Thomson-Bennett magneto.



(Left) Method adopted to fasten H.T. wire in brush holder. (Right) Magneto spanner, showing the gap gauge and special screwdriver.

A SUN GEAR BOX.

In the early part of 1916 the Sun Cycle and Fittings Co. hope to have a gear box with clutch and kick-starter ready for the different lightweights of the company's manufacture. This gear is already well in hand. The demand for quieter motor cycles has received the careful attention of the designers of the Sun motor cycles. In 1916 the exhaust will be rendered much quieter than in previous models by the addition of an extension pipe from the silencer.



The simple two-speed countershaft gear showing component parts

WILLIAMSONS FOR 1916

Output Limited Owing to War.

THE war has affected the Williamson Motor Co. in much the same way as all other motor firms, and as the result of the difficulty in obtaining materials, etc., their output for the present is extremely limited. The Williamson sidecar outfit, as most of our readers know, is a high-powered, luxurious mount, fitted with a horizontally-opposed water-cooled twin engine. A two-speed gear has been fitted up to now, but in future, when supplies are procurable, a gear box of the three-speed type will be standard practice. The sidecars are fitted with several types of bodies.

Just previous to the outbreak of war the new Williamson three-wheel cycle car was being tested. In this design the Williamson horizontal water-cooled engine is again used, placed lengthwise in the chassis, which is of channel steel, and driving by chain to an ordinary Douglas three-speed motor cycle type gear box, and then by another chain to the single rear wheel. An interesting point in the design is the fitting of torque tubes to all wheels. The back wheel is fitted in a separate framework, which is hinged to the chassis on a substantial bearing. This is sprung in the usual manner of three-wheelers on two quarter-elliptic springs. The front is sprung on threequarter-elliptic springs, while the axle is kept from whipping by two substantial torque rods, which are hinged in a similar manner to those fitted to the rear wheel.

THE TWO-SPEED COUNTER-SHAFT GEAR.

A TYPE of gear commonly used on two-stroke lightweights is the two-speed gear box in which the wheels are always in mesh and the change is obtained by means of a sliding dog clutch. From the illustration the simple construction and small number of component parts will be noticed. The layshaft pinions, which are made in one piece, are mounted on the shorter shaft, and mesh with the two pinions which revolve freely on the main shaft. These two pinions are provided with dog teeth, while the one seen within the gear box is attached to the driving pulley. The sliding dog is mounted on the main shaft, and is prevented from revolving independently by the long feathers. This dog is brought to engage either of the two gear wheels, so as to revolve them with the main shaft, and so produce the variation of ratios by means of the striking fork. Whether on top or low gear the wheels always revolve.

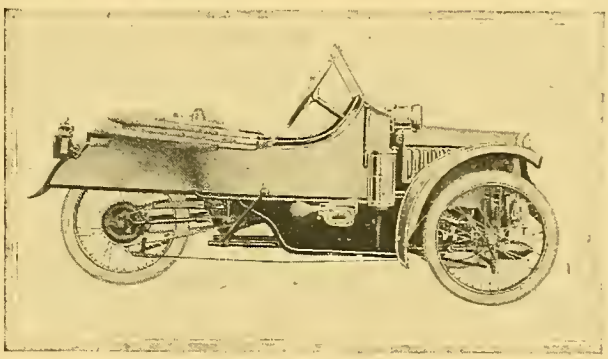
BUYERS' GUIDE ERRATA.

Unfortunately, a few errors have crept into the mass of information given in last week's issue. The price of the Enfield sidecar combination is now 85 guineas, or 100 guineas with Lucas dynamo lighting outfit.

It may not have been quite clear from our last issue that the New Imperial lightweight is supplied with two-speed gear but no clutch or kick starter at 35 guineas, as well as at 41 guineas including these fitments.

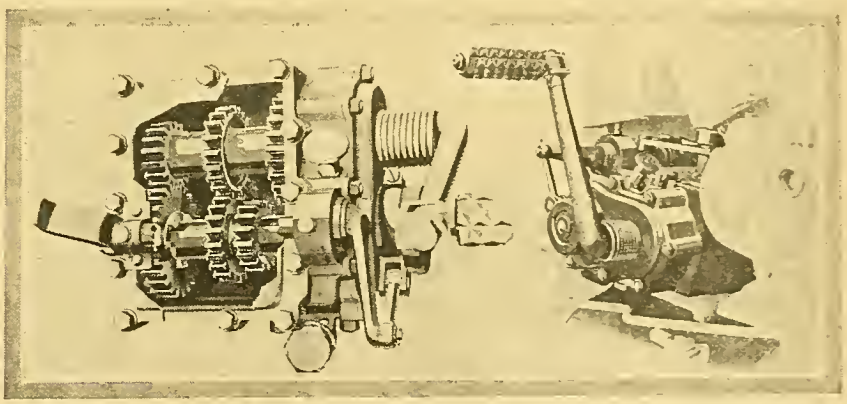
In the Royal Ruby lightweight models a two-speed machine costs £7 more than the same machine single-geared.

MORGANS IN 1916.



One of the standard Morgans for 1916.

THE Morgan runabout will be continued in three models for 1916. The first is the J.A.P.-engined model, the cylinder dimensions of which are 85 mm. × 85 mm. (980 c.c.); the next is the same chassis with an M.A.G. 1,100 c.c. engine; and the third is the Grand Prix model. The last-named has a wheelbase of 7ft., as compared with 6ft. of the first two models. It is an extremely fast machine, and one that has an established reputation, though this is a remark applying to all Morgan models. Features common to all three are Splitdorf magnetos, B. and B. carburetters, two-speed gears, and chain drive.



(Left) Kick-starter on 1916 Harley-Davidson. All the mechanism is enclosed, and the pedal is made to fold back when not in use. (Right) Three-speed gear and clutch-operating mechanism. (See pages 526-7 last week.)

A MODERN SYSTEM OF TYRE REPAIR.

By ROAD RIDER.

IT has always been a puzzle to me that the ordinary flat patch method of repairing inner tubes has proved as satisfactory as it has. The patch clings to the tube by means of a purely superficial contact, and the modern solutions show colossal tenacity in adhering at all, for they are subject to two permanent stresses, acting in different directions. On the one hand, there is a partly horizontal strain, seeing that the tube expands laterally under inflation, and the patch must expand with it if applied to a deflated tube; on the other hand, there is something of a vertical strain even in a pinhole repair, as the adhesion may be regarded as vertical between each square millimetre of the tube and the patch, not to speak of the blow-off strain when the hole is large enough for the air pressure inside the tube to exert a lifting strain on any appreciable area of the patch. The adhesion and tenacity of the patch rise superior to much careless and imperfect application, and to the great heat generated in the tyres of a fast machine driven at speed for miles together.

The strains on a patch are shown above in an exaggerated form.

(Top) Semi-horizontal, as tube expands under inflation.

(Middle) Vertical or lifting strain, as air pressure inside tube increases under inflation.

(Bottom) Mustikon stud in position. An almost air-tight seal secured, even before cup-head (corresponding to an ordinary flat patch) has been solutioned down.

If we get good repairs by this system, it is obvious that we should get better repairs from a system which employs a similar patch and similar solution, in conjunction with additional qualities; and for this reason I was much interested in a Mustikon repair outfit which I began to employ last season. The process has been described in these columns, and need only be summed up very briefly. Its basic principle is the substitution of a double patch, the two flaps being joined by a thick rubber neck for the ordinary flat patch; the plug resembles an indiarubber collar stud with large flat head and base. The plug is held in tweezers, dipped in solution, and its base is pushed through the puncture, which is trimmed to an even contour by a small drill in the case of tiny holes, or by a pair of scissors in the case of a large patch. When the repair is complete it compares with an ordinary flat patch repair as follows:

(1.) The head of the plug remains outside the tube, and is solutioned thereto after the fashion of a normal flat patch, to which it exactly corresponds in every detail, except that two special advantages are secured.

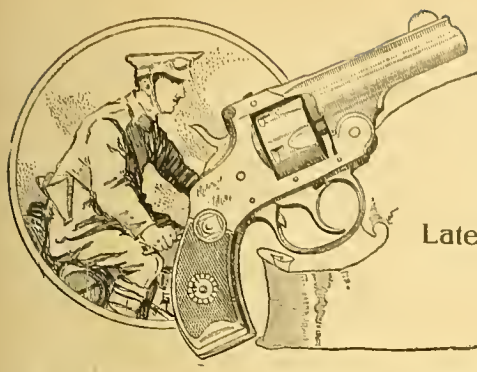
(2.) This head—otherwise equivalent to an ordinary flat patch—cannot "creep" or shift its location on the exterior of the tube, because it is rigidly locked into the puncture by the neck of the stud.

(3.) This head cannot "blow out," *i.e.*, is not subject to any lifting strain whatsoever, because the puncture—through which the air pressure in the tube normally blows at the patch—is plugged by the neck of the stud. For this reason the stud system effects reliable repairs to really large holes (even up to 2½in. in diameter); these are practically unrepairable by the flat-patch system, as in such cases only the edges of a flat patch possess adhesive contact, and so the flat patch cannot long resist the lifting air pressure on its centre.

(4.) With a flat patch repair, there is always a column of air pressure pushing up through the puncture, and seeking to find or make a path through the film of solution which joins the tube and the patch. With a stud repair, the puncture is plugged by the neck of the stud, which is fractionally larger than the puncture. I have more than once found a tube to be airtight after a stud was inserted before any solutioning has been done, showing how efficiently the stud seals the hole, supposing its neck really fits the hole, and supposing that the hole has been trimmed or drilled into a true circle.

(5.) In addition, the base of the stud adds a further safeguard. Its rubber is so moulded that it springs up against the inside of the tube as soon as the stud is in place. The solution in which the stud is dipped as a lubricant prior to insertions helps this spring-base to cling firmly to the inner wall of the tube; and when the tube is inflated, the air pressure further assists the contact.

I submitted the process to a long trial before writing about it, as I fancied it might be possible for an amateur to mismanage it in use; but it now strikes me as a sounder and simpler process than the normal method. As most motor cyclists cannot employ vulcanisation, seeing that they do not carry spare wheels and cannot readily insert spare tubes, the Mustikon method deserves their best attention.



MILITARY NOTES.

Latest Recruits in the M.M.G.S. A Useful Tip from the Front.

THE RECRUITING SECTION.

AS we stated in our last issue, recruiting for the Motor Machine Gun Service ceased on Wednesday, the 24th ult., when the following men were examined and passed on that date by Mr. Geoffrey Smith, Inspecting Officer for the M.M.G.S.:

E. L. Appleby (Castle Cary).
A. R. Ashby (Sheffield).
D. M. Birkbeck (Hull).
P. Boult (Stoke).
G. B. Collins (Yeovil).
J. W. Crofton (Grimsby).
B. Crossley (Kendal).
E. Cutts (Coventry).
E. J. Edwards (Newhaven).
D. Foster (Oxford).
R. R. Garlick (Cape Town).
L. C. Groutage (Erdington).
C. N. Harrison (Putney).
A. E. Hemington (Sheffield).
D. Hill (Edgbaston).
W. Illingworth (Middlesbrough).
C. Jones (Coventry).
F. Lewis (Watford).
R. MacDonald (Ely).
J. W. Makin (Bolton).
A. U. Malcolm (Edinburgh).
C. B. Mason (Acocks Green).
L. H. McAdam (Toronto).
J. Milliken (Liverpool).
A. Nichol (Hull).
A. Parkinson (Longridge).
C. F. Phillips (New Malden).
F. R. Pickworth (Bingham).
R. Reiffer (Sydenham).
H. Savage (Hunslet).
A. G. Selby (London).
A. Sims (Derby).
J. Stagg (Yeovil).
S. J. Sulston (Worcester).
H. E. Teft (Gainsborough).
H. J. Tiffin (Kirkoswald).
A. Till (Boreham Wood).
F. Turner (Matlock).
V. Ursell (Coventry).
W. Walker (Loftus).
T. F. Wilson (Grasmere).
A. Wood (London)

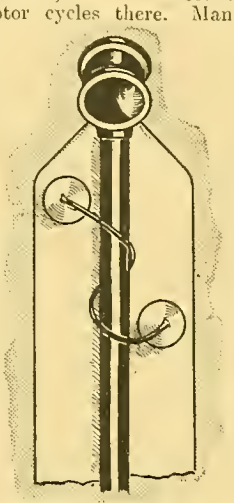
R. R. Garlick, who enlisted in the Motor Machine Gun Service last week, is a son of the proprietor of Garlick's Stores, well known to Cape Town and district motor cyclists.

PROMOTIONS.

FROM the *London Gazette:* Corporal (motor cyclist) G. G. Boynton, from R.E. to be temporary 2nd Lieut. (September 28th); Corporal (motor cyclist) G. Price, from R.E. to be temporary 2nd Lieut.

SECURING TANK FILLER CAPS.

THE other day we had the pleasure of meeting Lieut. S. A. Rowlandson, who is home on leave from the Front. Mr. Rowlandson is attached to General Headquarters, and is officer in command of motor cycles there. Many other well-known motor cyclists are with him, such as Sec.-Lieuts. C. S. Burney, "Rover" Newsome, and Dudley Noble. Rowlandson told us that the motor cycles generally have behaved remarkably well, considering the severe work to which they are put. A common trouble which he mentioned to us, but which we do not remember having seen in print before, was the continual loss of tank filler caps, due to the excessive vibration caused by the wretched *pavé*. The continual call for filler caps led to a shortage, and consequently a useful tip has now been adopted, at Mr. Rowlandson's suggestion, to prevent filler caps being lost in future. The idea is illustrated. It simply means taking a short length of Bowden wire cable, giving it one turn round the top tube, and soldering each end to the tank filler caps. Thus if they are caused to jump out of place due to excessive vibration, they are anchored securely, whilst it is a great convenience when replenishing tanks, for the caps cannot drop to the ground and roll away into some inaccessible place after the aggravating manner of such things.



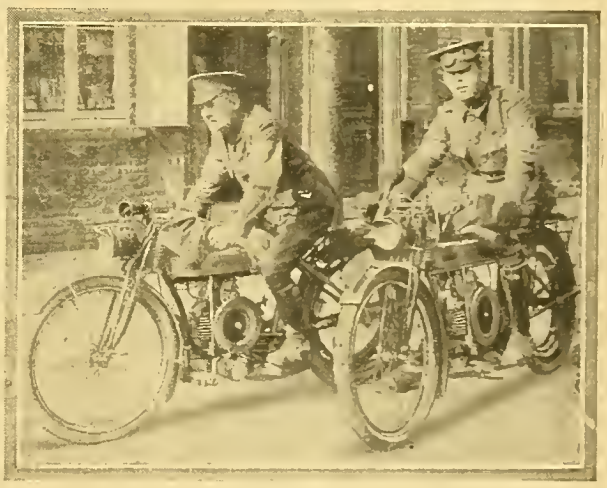
Method of securing filler caps described on this page.

"A SEA OF MUD."

THE above is the description applied to the present state of the roads in that part of France in which a reader, Motor Cyclist T. G. Chatwin, is stationed. His Triumph, he continues, gives great satisfaction in spite of it all.

THE STRAIN OF ACTIVE SERVICE ON MOTOR CYCLES.

CORPORAL ALFRED B. WADE, the former Zenith rider, has sent us a most interesting letter from the No. 1 Battery M.M.G.S. As mechanic in charge of the machines in this battery he has many opportunities of studying their behaviour under service conditions and noting the development of weak spots in design and construction. One of the toughest propositions to be tackled is that caused by the constant "hammering" vibration set up by *pavé*, which must be borne in mind when designing any type of vehicle for active service in France. It is far more destructive, says Corporal Wade, than any other form of vibration and stress he has previously encountered. One result is that the constant hammering very quickly causes "fatigue" of the tubes In conclusion, Corporal Wade mentions the great desirability of stands for sidecar wheels.



Two Douglas mounted despatch riders, Corporals G. W. Baker and Leeds, attached to one of the Signal Companies in France. The former, we regret to say, died a few days ago as a result of a fall from his machine.

Motor Cycles for the Italian War Office.

Before being finally passed over to the military authorities each Indian sidecar outfit that is supplied to our Italian Allies undergoes a forty miles road test. On specially severe routes, which are easily found in Italy, forty miles at speed with three people up will soon find out any weaknesses.

A New Metal.

A correspondent sends us a cutting from *Machinery*, which describes a new metal which has been produced in the United States, and is intended to fill the gap between iron and aluminium. It is named Krauselium, and is prepared in four grades possessing the following physical properties :

Grade	Specific gravity	Tensile strength lb. per sq. in.
1 ..	1.92 ..	35,000 and over
2 ..	2.04 ...	29,000 ,, ,,
3 ..	2.12 ...	23,000 ,, ,,
4 ...	2.16 ...	21,640 ,, ,,

This metal is the product of the Polyphone Motor and Manufacturing Co., St. Louis; it is, we imagine, an alloy containing aluminium as its principal constituent, and should be most useful in the motor trade.

Reduced Lighting Prosecutions at Banbury.

All motorists convicted at the Banbury Police Court in respect of infringements of the reduced lighting Order at Banbury, occurring since April 9th, are requested to communicate with the secretary of the Automobile Association and Motor Union, 66, Whitcomb Street, London, W.C. In a recent appeal to Quarter Sessions, it transpired that this Order was revoked on the date above mentioned, and the Association proposes taking the necessary legal steps to secure the annulment of all such convictions, and the remission of the penalties imposed.

Military Motor Cycles for Russia.

Two thousand Indian motor cycles have been supplied to the Russian Government. In addition to these, it is common knowledge that several well-known British manufacturers continue to send regular consignments to the same country, so that by now our Ally must have a very considerable fleet of motor cycles.

Bad Road North of Carlisle

We have received information that the road to Scotland from Carlisle is in a terrible condition just north of that city. Drains of some kind have been laid down, and frost has set in before the surface could be levelled over. Our informant says that it is almost impossible for the average machine to negotiate it. He rides a 7 h.p. twin, which has a large ground clearance, and he writes, "I do not know how I escaped without a broken crank case. As it was the drain tap was broken clean off, and I badly bent one of the sidecar arms."

Lantern Slides as an Aid to Recruiting.

As showing the value of lantern slides as an aid to recruiting, we may cite the experiences of Mr. S. W. Phillpot in his capacity as secretary of the Motor Cyclists' Reserve Committee, West Lancs. Divisional Area. Perhaps the best slide from the point of view of attracting prospective despatch riders was from a striking photograph of motor cyclists in the Dardanelles that appeared in *The Motor Cycle* of August 19th. The result has been so satisfactory that Mr. Phillpot has had to stop temporarily the exhibition of the slides, but they will shortly be going the rounds of cinemas and music halls in Manchester and the West Lancashire Area.

The Biter Bit.

A young R.E. officer, who is not unknown in the motor cycle world, recently came home on five days leave. Hearing that recruiting was very active in London, he slipped into *mufti* and promenaded the streets, hoping that some unsuspecting sergeant would recruit him. He meandered round Piccadilly Circus, drifted into Trafalgar Square, mingled with the crowd at the recruiting meeting, and planted himself under the nose of every sergeant who was wearing the national colours, but all to no effect. History relates that he was so disgusted that he went home and went early to bed. The next morning he was determined to be-told that his "King and Country" needed him, so he followed more or less the same route and the same procedure, but still had no luck. Getting desperate, he walked down to the Central Recruiting Office in Whitehall, and sauntered up and down before the sergeant outside. Still no luck. Driven to desperation, he walked up to the sergeant and said, "Well, sergeant, and how's the recruiting?" "Fine, sir," responded the sergeant; "we are hoping to send you out a very big draft shortly!" Collapse of officer.

More Illuminated Policemen.

We are glad to see that the illuminated policeman scheme is spreading. Leeds has gone one better than parts of London, for not only will the policemen have red lights behind, but also white lights in front. Of course, only police on traffic duty will be so equipped.

Captain Noel E. Drury

A few weeks ago we mentioned that Noel Drury, whose name is almost as familiar to English competition riders as to those in Ireland, was on the Gallipoli Peninsula. We now hear that he has been promoted from lieutenant to captain in his regiment, the 6th Battalion Royal Dublin Fusiliers.

Police Activity in Bromley.

We have received information of a police trap in the Bromley ten-mile limit, there being a measured furlong from the Market Square in the direction of the railway station on the new wood paving. A twenty-mile limit measured furlong is also being worked regularly at week-ends between the Catford Town Hall and the A.S.C. Depot on the Bromley Road.

A General Lighting Order.

Some weeks ago we referred to the possibility of there being a general lighting order to be in force throughout the United Kingdom. This, we understand, will come into operation in the very near future. It is especially gratifying to note that what practically amounts to a definite standard of lighting has been decided upon. As things are at present it is difficult to imagine a more ludicrous, or rather annoying, state of affairs than the existing regulations in which nearly every town and county almost has a different set of lighting rules from its neighbour.

Good to look at.

One of the impressions gained by a perusal of the complete Buyers' Guide that appeared in the last issue of *The Motor Cycle* is that a distinct improvement is to be observed in the general appearance of 1916 machines. True, there are still some rather ugly ones, but the average motor cycle, especially the twin-cylinder, is generally of very pleasing appearance.

While on the subject of the complete Buyers' Guide, we should like to thank those readers who have written complimenting us upon the last issue.

Dark Streets worse than Zeppelins?

Last Sunday's *Weekly Despatch* contained some interesting information under the above heading. Figures are given which show that the number of people killed by vehicles in London has enormously increased since the new darkening regulations came into force. For the same period of the year (October 11th-November 22nd) the number of road fatalities in 1913, 1914, and 1915 were as follow: 59, 85, and 121. Since September 7th 162 people have been killed by Zeppelin bombs, and since October 11th 121 people have been killed by vehicles. These figures confirm the remarks we made some months ago, when we stated our belief that, as a result of the new lighting regulations in London, more people would be killed by vehicles than by bombs from hostile aircraft.

A.J.S. Dividend.

A. J. Stevens and Co., Ltd., manufacturers of the A.J.S. motor cycles, have declared a dividend of 10%. The profit for the year ending August 31st was £5,956.

Government Orders for Cars.

At the annual meeting of the Swift Cycle Co., Ltd., last week, the Chairman expressed the surprise and regret of the directorate at the failure of their attempts to obtain orders from the Government for their cars, despite the fact that thousands of American cars were being used. Here is a case when gold *could* have been kept in this country.

Juggling with a Motor Cycle.

Interest has been aroused by the illustrations of trick riding published in *The Motor Cycle* of a fortnight ago, and in particular by the fact that the machine used is an old one. It is a 2 h.p. Minerva which has been modernised by the rider, Arthur Bryden (not G. A. Roberts, as originally stated), of New Wortley, Leeds. Bryden is only 17 years old, and has already shown himself a successful competition rider in addition to being a clever exponent of trick riding.

D.C.M. for Motor Cyclist.

The latest list of men awarded the D.C.M. contains the name of a despatch rider, Corporal H. G. Cooper. The official notice reads: "(Motor Cyclist) H. G. Cooper, 9, Southern Provinces Mounted R. (Madras). For conspicuous gallantry on July 14th, at Mbuyuni (East Africa), when he carried messages on foot under a very heavy fire to and from the firing line, and, though severely wounded, with great coolness and bravery continued his work, and delivered all his messages safely. His devotion to duty was most marked."

Motor Cyclists and Recruiting.

We have received quite a number of letters from readers expressing their regret that recruiting for the Motor Machine Gun Service is closed. It appears that some readers were settling their affairs in the hope of joining this branch later, and were not expecting to see the announcement in our last issue.

Second-hand Machine for a War Fund.

A 1912 clutch model 3½ h.p. Triumph has been presented to the National Cyclists' Union to be sold on behalf of the Union's prisoners of war fund. The machine has been well overhauled and is said to be well worth £20, and the highest offer above that figure received by December 15th will be accepted. The N.C.U. offices are at Lonsdale Chambers, 27, Chancery Lane, W.C.

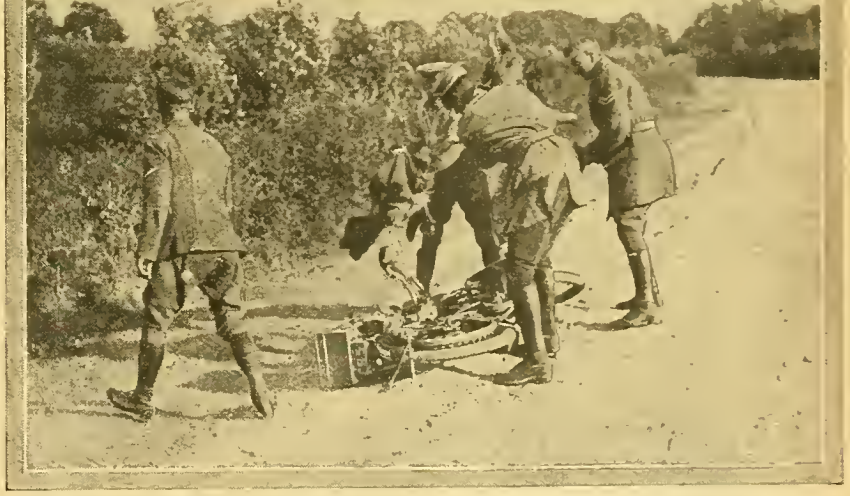
Proposed Bicycle Tax.

The following resolution is being passed by rural district councils in Norfolk: "That in view of the heavy cost of maintenance of roads and parish highways, the burden of which falls entirely upon local rates, the Chancellor of the Exchequer be asked to consider the probability of imposing a small tax on all users of bicycles, the revenue from the same to be applied in aid of local taxation."

The National War Funds.

At the week-end the principal funds stood as follows:

The Prince of Wales' National Relief Fund (£2,673,000 distributed)	£5,622,609	0	0
The Times Fund for the Sick and Wounded	2,333,298	0	0
The *Weekly Dispatch* Tobacco Fund	90,248	1	4
The Queen's Work for Women Fund	167,127	2	5
The Belgian Relief Fund	1,180,000	0	0
Daily News Xmas Pudding Fund	19,191	0	0
Daily Chronicle Xmas Gift Fund	15,044	7	5



QUICK WORK IN AN EMERGENCY. A despatch rider's machine catches fire following a fall. The photograph was taken near a D.R. training centre, and shows what to do in the case of a fire. Flames can be beaten out with caps and coats assisted by gravel.

Motor Cycle Clothing for Both Sexes.

WITH the approach of winter the question of warm clothing is again present in the minds of most motor cyclists. In this connection we recently had an opportunity of inspecting at the Euston Road premises of Messrs. Alfred Dunhill, Ltd., a tan leather motor cycle suit. This, we may point out, is in no respect like the old leather suits which were in vogue when the pastime first came into prominence. It is made of the best quality tan chrome dressed skins, and lined with camel fleece. The coat is double-breasted, and is provided with a belt, and there are also wind cuffs. It is somewhat of a novelty to have leg overalls with a coat of this kind, but Messrs. Dunhills have satisfactorily solved the problem, and, as will be seen by the accompanying sketch, have produced an excellent pair of overalls, provided with straps at the bottom, so that their lower extremities may be tightly fastened round the ankles. The leather is beautifully soft, and, of course, exceedingly warm, and, moreover, should stand a considerable amount of rain.

An ideal suit for winter riding. It is a tan leather jacket and overalls made by Dunhills.

Messrs. Dunhills have also not lost sight of the fact that motor cycle riding is becoming more and more popular with ladies, and they have designed a special skirt which the wearer may use on either a gentleman's or lady's machine, while in walking it has the appearance of an ordinary skirt, as is seen by the smaller sketch in the second illustration. The coat is made in the tunic style, with a wind flap in front, and ample pockets, while it is provided with a strap collar and cuffs, which fasten closely at the neck and wrists, keeping the rider warm. It may be had in Dunwear waterproof cloth, in proofed covert coating or Lovat tweed, or in Drencherproof tweed. In view of recent correspondence in *The Motor Cycle*, the Dunhills lady's costu is very interesting, as it shows, we c sider, that a woman motor cyclist n not be unsuitably dressed.

The Dunhill motor cycling costume for lady riders

A.A. Special Constables.

The rifle shooting competition h in the range of the A.A. between t various squads of motor cycling spec constables came to a conclusion a f days ago. The winning team was unc Sub-Inspector Ernest Frasetti.

WAR WASTAGE OF MOTOR VEHICLES.

A large batch of Army motor cycles, with a few lorries in the background, waiting at a repair base, where many of them will be put in good repair and ready for renewed active service. In this connection we are reminded of a matter we brought forward in "The Motor Cycle" some months ago, *i.e.*, the scrapping of motor cycles which could at small expense be put in thorough running order and sold to dealers with a view to relieving the second-hand market.

The Automobile Association Se tion of the Special Constabula still has a few vacancies for mot cyclists and motor car owners wh are prepared to give up a portic of their time to the duties unde taken by the section.

The Lancashire Avoiding Route.

Confirmation of Our Opinions. Use Direct Route Except in Very Bad Weather.

ON September 16th we published a paragraph referring to the main Warrington-Wigan-Preston road and the avoiding route suggested and signposted by the R.A.C. In this paragraph we suggested that if the R.A.C. could spare a representative to again inspect both routes a benefit would be conferred upon the motoring community. This has now been done, and we append the R.A.C. representative's report, forwarded to us by Mr. J. W. Orde, secretary of the R.A.C.

ALTERNATIVE ROADS BETWEEN WARRINGTON AND PRESTON.

In accordance with instructions, I inspected the alternative roads between Warrington and Preston on October 20th and 21st, and report as follows :

1. Direct road viâ Wigan.—From Warrington to Ashton-in-Makerfield, road fairly good; tramlines run for two miles out of Warrington and for a short distance into Ashton.

From Ashton-in-Makerfield through Wigan to Standish tramways run the whole distance, and the road surface is built of granite setts either the whole width of the road or the width of the tramway track. In places the setts present a bad and uneven surface. There is no difficulty encountered in driving over this part of the road in dry weather, but the surface is obviously treacherous in damp weather. The roads throughout Wigan and the traffic thereon are by no means difficult. A finger-post is required at one point on the south of Wigan showing the way to Warrington.

From Standish to Preston the road is fair to good the whole distance, and runs through a rural district.

The distance is twenty-nine miles, of which about ten miles carry tramlines.

2. Viâ Knowsley and Ormskirk.—Between Warrington and Prescot the road generally runs through an industrial district, with tramlines both on leaving Warrington and entering Prescot, but neither road nor traffic conditions present any difficulty. The road generally is distinctly good. Sankey Bridge, although not finished, is available for traffic the full width.

From Prescot to Ormskirk the district is generally rural in character, and the road is fair to good the whole way, although, like many other roads in the district, half the surface is in places laid with old stone setts.

From Ormskirk to Preston one has a good main road throughout, traversing, except at Burscough, a rural district.

Penwortham Bridge is now open for traffic.

The distance is forty and a half miles.

Our signposting is undoubtedly perfectly efficient, and any driver looking for the guidance of the signs should have no difficulty in following them. Signs all require repainting badly, and I will take steps to have this done.

3. Viâ Prescot and Rainford. This road throughout is of much the same character as that *viâ* Ormskirk, which it leaves either in Prescot or Knowsley and rejoins at Burscough. The distance is practically the same, but it is a little difficult to follow at some points, and reference to the map is necessary. If this road is followed it appears to me to be unnecessary to make the *détour viâ* Knowsley, as one can go straight from Prescot on the eastern side of Knowsley Park.

Conclusion.—The direct road *viâ* Wigan gives a saving in distance of eleven and a half miles, and presents no real difficulty, at least during dry weather, but for half its distance passes through a sombre industrial district. Where time and distance are important, I would recommend this road, but for the touring motorist having no desire to traverse roads of this character the alternative road *viâ* Knowsley and Ormskirk, which we have already signposted, should still be recommended. The alternative is to be preferred in wet weather.

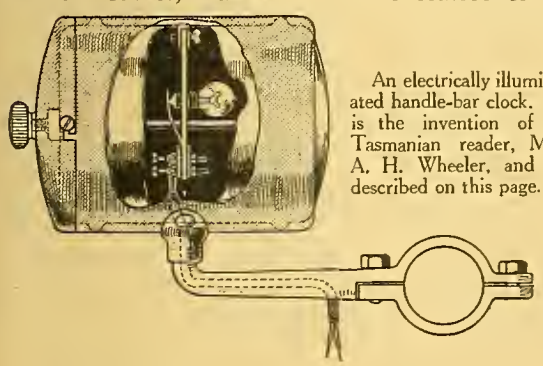
The third alternative, by way of Rainford, is not valuable, and offers no advantages over the other either in point of distance or ease of travelling. H.W.N.

November 24th, 1915.

Some members of the No. 6 Battery M.M.G.S. now on active service. Mr. F. K. Bolton, father of the second man from the right on the back row, kindly sent us the original photograph and says the copy of *The Motor Cycle* he sends out to them is read from cover to cover every week

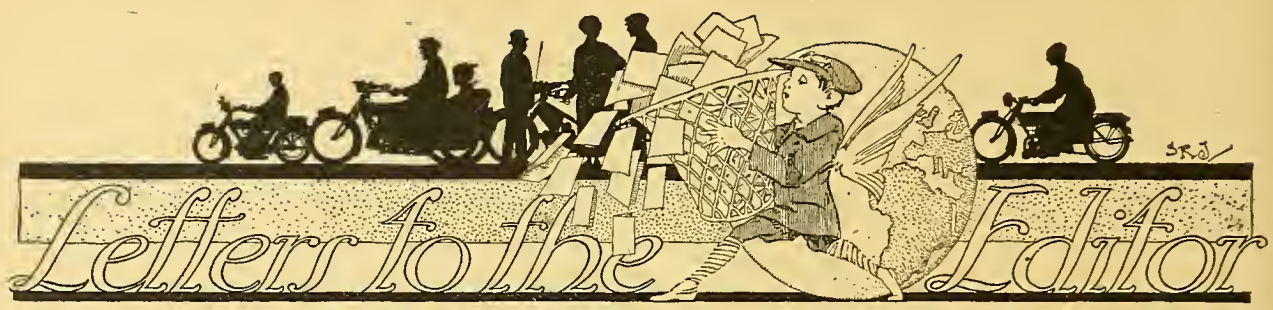
AN ILLUMINATED MOTOR CYCLE CLOCK.

AN interesting motor cycle or car clock has been designed and patented by Mr A. H. Wheeler, of Hobart, Tasmania. The feature of this instrument is that by pressing a button the face of the clock is illuminated and the time easily read on the darkest of nights. The clock mechanism is contained in the rear portion of the body, and the hands are driven by means of an extended shaft. In the space between the works and the face a small four-volt flash lamp bulb is arranged and coupled by means of a flexible cable to a small dry battery, which can be carried in any convenient position, such as the tool bag or a specially made case on the handle-bars.



An electrically illuminated handle-bar clock. It is the invention of a Tasmanian reader, Mr. A. H. Wheeler, and is described on this page.

The dial is made of ground glass with bold figures and hands, making it readable from a considerable distance. A fitting of this kind would undoubtedly be greatly appreciated by many riders, and especially in times of peace by competitors in such events as the London-Edinburgh and Exeter trials, and other all night rides.



The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," Hertford Street, Coventry, and must be accompanied by the writer's name and address.

A Sidecar Windscreen.

Sir,—With reference to Miss May Walker's article on the wind shield, I should be pleased to hear if she has used the screen during the summer. I fitted one very near to the passenger, and found that an eddy of wind was brought up from the back of the sidecar and covered the passenger's head and shoulders with dust, and this was cured by putting the screen nearer the front.

Wishing your journal continued success,

A NINE-YEAR-OLD READER.

Dangers of Darkened Streets.

Sir,—The "Member of the Illuminating Engineering Society" writes a long and interesting letter, but he surely forgets that his letter does not get to the right people, as the majority of readers appreciate from their own experience his troubles. He is writing to fellow sufferers. His letter should be sent to the dailies and evening papers. I think the main point and basis of the trouble is the utter imbecility of the present lighting laws (*sic*), for over a year we have suffered like fools this lighting absurdity. It never prevented Zeppelins from reaching London, nor had any effect on their dastardly work when they did. Now we are told no more will ever reach the Metropolis, so for Heaven's sake let us kick and kick till the lights are restored, and our lives and limbs safe from our own people. If it did any good no one would object, but time has proved that the remedy is useless, and is worse than the disease.

SOLE MEMBER FOR THE SOCIETY FOR ILLUMINATING LONDON.

Freemasonry of the Road.

Sir,—We have heard so much recently concerning the "road sponger" that it might be of interest to your readers to hear the other side of the question.

I am possessed of a certain 1915 4 h.p. machine, which, although its behaviour in other ways has been exemplary, has, in the course of 10,000 miles, broken four countershaft pulleys. I will relate the circumstances regarding the incidents separately.

First pulley. Cornwall, ten miles from a town. Dark. Seven motorists in a four-seater found room for me unasked, and conveyed me to the town.

Second pulley. Kingston Hill. Driver of a Singer light car asked to give me a lift to Putney. Drove me to my bank in town, waited, and finally deposited me at my destination.

Third pulley. Orpington. Given a five-mile lift on the carrier of a sidecar combination.

Fourth pulley. Near Henley, on November 9th last. Pelting rain. A motor cyclist stopped, and, although I was a total stranger, offered to lend me his own motor cycle to return to Henley, saying he had only a little way further to go, and would walk it. Whilst we were talking a lady in a car approached, and gave me a lift into Henley.

In view of the above facts, who can say that the freemasonry of the road is dead? The above are the only times I have been stranded this year, and three times out of the four it was a car driver who rescued me.

I should like once more to express my gratitude to these various good Samaritans, and to hope that the day may come when I shall be able to repay a part of my debt.

E. RIDER TROWARD.

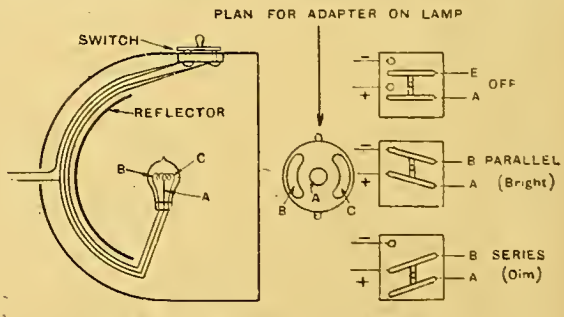
Winter Riding.

Sir,—To keep a machine clean in winter the easiest way is to remove as many fittings as possible which can be dispensed with for the time being. Then polish every part with Johnson's prepared wax. This imparts a hard brilliant gloss almost like varnish, and when the mud dries it will brush off as easily as dust. Greasy substances, such as vaseline, collect the dirt and make it very difficult to remove, besides giving a most unsightly appearance to the machine. C.E.B.

Sir,—Regarding keeping dry, I certainly think oilskins far the best, as Mr. H. M. Batten suggests. I find the following very good. Sew a piece of oilskin to the bottom of overall like the front of a spat, and at the side put a button and a broad piece of elastic 18in. long with a hole at the end. When on, fold the overall as you would trousers for a clip, and wind the elastic once round the leg, cross over, and once under the foot, and over the spat like a figure 8, and fix the end on the button. Of course, the fold will end where the button is. This arrangement gives room to put on easily, and keeps out wind and wet. Hundreds may use it for all I know, but it may be new. (Rev.) L. GREGORY.

Variable Electric Lights.

Sir,—Having seen in recent issues of *The Motor Cycle* articles on the new lighting rule for motor cars and motor cycles, I should like to suggest the following idea: None of the ideas you have yet published deal with a solution of this difficulty with regard to electric lamps. The theoretical solution is surely to have two lamps, which can be used either in series or parallel at will. Assuming the e.m.f. to be constant, the theoretical result would be a quarter of the light on series using a quarter of the power. Of course, this would not be procured in practice, but the results should be good enough to satisfy even the most fastidious purchaser.



Wiring diagram of electrical lamp to meet lighting regulations. (See letter from H. E. I. Palairet on this page.)

As a motor cyclist, when riding solo, requires one lamp only the two lamps have to be run into one. This can be done by means of an ordinary lamp with an idle lead A tapping the middle coil, and suitable leads.

In parallel the current flows on at the + terminal, through the switch to the lead A, and divides at the lamp through the coils B and C. From C it goes straight to the terminal, from B through the switch to the terminal. In series the lead A is cut out. H. E. H. PALAIRET.

Help on the Road.

Sir,—The more I am on the road the more I feel what a comfort it would be if there were some simple and recognised signs between the apparently stranded motor cyclist and the one who is willing to help him.

In the present state of things, both parties yell out some unintelligible words, and by the time the driver has made up his mind whether he is wanted or not, and has pulled up, he is a good way past. On going all the way back, in nine cases out of ten, he is told, in a very curt manner, that he is not wanted, with the result that he is not so keen to look into other people's troubles in the future.

Are there any objections to the following suggestion: The driver who is willing to assist holds out his hand (fairly low down) on the side that the man is in trouble, who, if he wants help, holds his hand above his head, so that even if the driver is a good way past he can see it over his shoulder.

ANY HELP?

A Curious Incident.

Sir,—About two months ago I fitted my Triumph with a vaporiser in the form of a spiral spring over the jet. The other day I had occasion to take down the carburetter, and, to my surprise, the vaporiser had disappeared. A careful search on the floor failed to find it and on consulting an expert friend, he suggested that the vaporiser might have got loose and been sucked up the air chamber and through the induction pipe into the engine. It seemed scarcely credible, but on taking off the valve caps the vaporiser was found lying in the combustion chamber in the groove which runs round the chamber under the level of the inlet valve.

Not only that, but another similar vaporiser was found lying beside it, and I then remembered that last July I had occasion to take down my carburetter by the roadside for a choked jet, and the spiral spring vaporiser went mysteriously amissing there also, but I thought it had fallen out as I took down the carburetter and had rolled among the grass at the roadside. Both vaporisers seemed a fairly tight fit for the jet when put on.

Lying as they did in the engine they made no apparent difference to the running of the machine. Is such an occurrence an unusual one? JOHN F. FERGUS, M.D.

Petrol Consumption on Two-strokes.

Sir,—I have been much interested in the correspondence about petrol consumption on two-strokes, and, being the rider of a T.D.C. Wolf, I am writing to you to know if any of your correspondents would be so good as to help me in my small difficulty.

My petrol consumption is heavy, 70-80 miles to the gallon, and I find that, although I never flood the carburetter, even when starting, there is always a pool of petroil on the plate I have fixed under the carburetter to catch these drainings and prevent their getting into the contact breaker. I cannot account for them. The level is true; I have tested it carefully, and the carburetter is not tilted The only thing I can think of is that there is a back rush of mixture when the port closes; and, as there is no induction pipe, and the carburetter is a Senspray, it comes straight through into the air inlet. I am running on a jet equal to about 32 B. and B. (I don't know Senspray numbers), and the machine climbs magnificently, and will travel at 27-32 m.p.h. uphill and down dale for as long as you like. It pulls like a three-horse twin, and I have nothing but praise for it. M. P. SARGENT.

The Lady Motor Cyclist—A Protest.

Sir,—Regarding the opinions expressed in your paper on the question of the lady cyclist's dress: although I do not think it right that anyone should dictate to another what they—he or she—should wear, I would like to put the matter in a logical way.

First of all, man and woman are designed almost alike in general outline; woman is now taking her place beside man in work and play as an equal, and as she becomes more practical in her ideas she will very soon see that it is silly to handicap herself by clothing which immensely restricts her movements. The days of the simpering maid have gone with the crinoline, and the sooner the woman discards the skirt, the high heel, and the stays, the quicker will be her progress.

The practical woman aspires to be more the chum of man than his idol, and she is wise; for his friendship is likely to last longer than his "worship." Mary Reid wants to "sit her steed with gracefulness," and she thus unconsciously discloses her desire for man's good opinions; but no person with any powers of reasoning could say that a hobble skirt is graceful. If Mary Reid has conformed to the fashions she is wearing one, and breeches could by no possibility be worse looking. To get the maximum of gracefulness she should wear an "Empire gown"; the flowing draperies would be extremely pretty when travelling at speed.

The lady's frame may be strong enough, but it is mechanically impossible for it to be as strong as a diamond frame, and if a woman has the courage (and the money) to become the user of a "mo-bike," then she is silly as well as inconsistent in her ideas if she buys anything but a man's model, which she can again dispose of, if she wants to, much more easily than a lady's.

I shall welcome the day when women adopt a rational dress, but the pioneers of the movement must expect to hear that they are "slightly touched," etc., to quote your correspondent again. Before she dies she will probably have to get into breeches every morning or be out of the "fashion."

LOGISTES.

Sir,—Writing as a medical man, and also as a motorist of considerable experience of many types of machines, may I suggest that one aspect of the question has not received attention in the correspondence which has hitherto appeared in *The Motor Cycle* on the best type of machine for lady riders. It is this. The open frame, in addition to, and because of, its inherent structural weakness, has the effect of magnifying the vibrations from the engine, so that at anything over, say, 20 m.p.h., it is, on many types, almost impossible to hold the handle-bars firmly. Moreover, this "dither" is most distressing on a long run, and tends to produce a nervous tremor which lasts for some time.

Furthermore, as is recognised by the manufacture of rubber tank pads, many riders like to grip the tank with their knees, and find additional steadiness and safety in so doing. This is abolished with the open frame.

Now, sir, is it right to expect the weaker sex, constitutionally more nervous and highly strung than the male, to ride a machine possessing these inherent disadvantages? With a wide ordinary skirt, or, better still, with one of the admirable double skirts on the market, it is possible for a lady to ride a diamond frame without loss of dignity or grace, and would it not be well to relegate the open frame to the limbo which is in the act of absorbing that similar product of perverted prudity, the side-saddle for horsewomen? MEDICO.

A SPORTING LIGHTWEIGHT PASSENGER OUTFIT.
A two-stroke Allon owned by Mr. A. O. Goncalves, of South Woodford.

Water on the Knee.

Sir,—Although not a medical man, but a pharmacist, I am taking the liberty of replying to the enquiry of "Medically Unfit," and my reason is a rather long and bitter experience of a similar trouble. I should say that motoring has nothing to do with his indisposition: there must be some other cause, for which only a medical man knowing all the history of the case could account. From my own personal experience, the only remedy is *absolute* rest for the joints for a somewhat prolonged period; in my own case, in plaster of Paris bandages. For a promised quicker relief I tried practically every other method suggested by one and another professional man, and spent much money and time, which I think I might have saved had I accepted the first advice, but which necessitated my lying up for three months at least. I regret I did not take this advice, but after twelve months of treatment, some of it very severe, I was very glad to adopt the sound proposals of the first medical man I consulted, and after every appearance of being somewhat of a cripple for the rest of my days, a complete cure was effected, and I am once again able to enjoy the pleasures of motor cycling. It would be no good to the majority of your readers to go into any details, but the Editor has my address, and if "Medically Unfit" cares to write me, I can perhaps help him. PHARMACIST.

Engine Rattle in Two-strokes.

Sir,—I have had the same experience as your correspondent "Scud" on a single-geared two-stroke. When travelling at about twenty-five miles per hour the engine seems to be working, as he says, with difficulty, and when the compression release valve is opened a loud hammering sound is emitted, which increases to an alarming extent if the machine gains speed down hill.

The fact that the noise is non-existent for some time after cleaning points to carbon deposit being the cause. A ring of carbon is formed about one inch from the top of the cylinder, and it is my opinion that when the piston is hot and expanded it knocks against this. Two things lead me to think this. Firstly, when I dismantled my engine, I found the sides of the raised portion of the piston head were well polished, as if they had been coming into contact with something. Secondly, on one occasion I was running slowly down hill, with the compression release valve open to the accompaniment of the usual clatter, when something seemed to snap inside the engine. I could, however, find nothing amiss, but was surprised immediately afterwards to find that the noise had almost entirely ceased. For the next hundred miles or so this state of thing continued, but after that the noise gradually increased again. My theory is that the snapping sound I heard was the breaking away of part of the aforesaid carbon ring, which would account for the subsequent absence of rattle. I may be entirely wrong in thinking this, but at any rate I believe carbon deposit is primarily the cause of engine rattle.

LL 9026.

Reversing a Scott.

Sir,—I have been interested in the two recent letters calling attention to the fact that a Scott two-stroke occasionally, or even frequently, reverses when starting up. I have a 1915 Scott fitted with Splitdorf magneto and a B. and B. 1915 carburetter, and the same thing often occurs. Sometimes it is a nuisance, but I have occasionally turned it to good advantage to back out of a yard. I can usually make the engine run in the right direction by slowing it down with the throttle and slightly braking the engine with the clutch and foot brake.

Some of your readers may probably be interested in the results I am obtaining with the machine. I have attached a Millford family sidecar to it. This is fitted with a windscreen, and has seating accommodation for an adult and a child. The whole outfit runs splendidly, and will climb most ordinary hills on the top gear of 5 to 1. The machine has run a distance of 2,400 miles, about 1,900 of which have been with the sidecar attached, and although the cylinder and pistons have not been down at all it shows no signs of knocking or loss of power. In fact, the petrol consumption is better than ever it has been, largely due to more careful driving with the extra air lever, together with trial adjustments to the needle of the carburetter and with the ignition rather more advanced than usual. I am getting 75 m.p.g. with the sidecar, whilst on a recent out and home journey of 200 miles, using the machine solo, I obtained 105 m.p.g. on No. 2 petrol.

A tour this summer in lieu of the usual summer holiday, with two passengers and heavy luggage, included Leicestershire, Gloucestershire, Monmouth, Oxfordshire, Buckinghamshire, etc., a total distance of over 700 miles, without a single hitch of any description, notwithstanding the fact that I had then only had the outfit three weeks and had had no previous experience with motors or motor cycles.

W. HOCKNEY.

Clutch Operation and Transmission

Sir,—With reference to "Ixion's" "Occasional Comments" in last week's issue of your paper, I must take exception to his remark, "Up to date it has not proved possible to design a handle-bar clutch control which does not require a lot of hauling out." Has "Ixion" felt the clutch lever of a 1915 3½ h.p. Sunbeam? A perfect clutch action is provided, and the lever is as easily raised as the exhaust valve lifter.

Then, again, I see he advocates foot control of the clutch. Personally, I do not consider foot control can compare with hand. I always *slightly* slip my clutch in cornering, or even in accelerating, and I am sure that these finer touches cannot be given by the foot. Again, it is quite possible for the handle-bar muff to be fitted over the handle-bar clutch lever, and thus the chances are very slight of the fingers becoming so cold as to cause handling impossible.

How difficult it must be to "gently insinuate the clutch" (*vide* a well-known manufacturer's handbook) with cold feet under boots and Hutchinson waders. Also, what about when one has to declutch and brake, when riding in grease, for, in my opinion, declutching greatly reduces the likelihood to skid? (I am not mentioning the well-known point of both legs being required to recover balance when skidding.)

I should like to say a word or so with regard to the article "Chain-cum-belt Drive on Big Twins." I cannot believe it possible for a chain-cum-belt driven 5-7 h.p. twin to give a greater mileage per rear cover than the 3½ chain-driven single. I regularly get, by speedometer, 6-7,000 miles from a cover on the back wheels, and from one Dunlop I obtained 8,000 on back, 6,000 on front (14,000 in all), and this tyre was still in good condition when I disposed of that machine (it has done several thousands since and is still on). All this, please note, on a "harsh" chain-driven single (2¾ h.p. Sunbeam).

Then, again, the petrol consumption on my present mount (3½ h.p. Sunbeam) is a full 115 m.p.g.; this over muddy roads.

Then, with regard to cleanliness, I know which machine I would prefer to have for all the year round riding. The mud can remain on the chain case, but not so on the belt.

In 23,000 miles on Sunbeams I have only once had chain trouble (rear chain broke after 13,000 miles), and I have only renewed one chain (front one after 9,000 miles, at a cost of 7s.) in the whole mileage. I have nothing to complain of with regard to harshness of drive. My advice is, use your clutch as much as you like, but keep it clean and oiled. Never have I had clutch trouble.

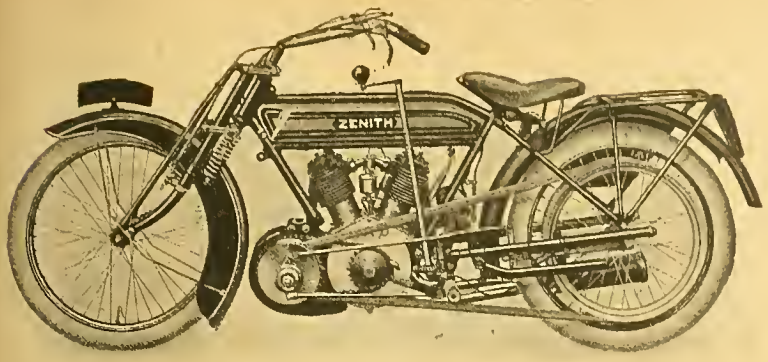
Also, what about the spares one has to carry with chain-cum-belt drive? I only carry a couple of detachable links, and it is a big advantage to be able to travel light on greasy roads, and not loaded with spares.

I see Mr. Batten admits that he is troubled with belt slip. This is a real bogey for any all-weather rider, and what disadvantage of equal importance can he cite with enclosed chain drive?

I frankly admit I am very keen on Sunbeams. You see in 23,000 miles one gets to know a good thing. I have ridden most machines on the market, but—well, my next machine will be a Sunbeam, too.

Surely if a chain drive is successful with single-cylinder machines, its success should not be questioned with the twin's more equal torque, and I should expect that with greater power and weight the disadvantages of chain-cum-belt would be increased.

I must apologise for the length of this letter, and must say, with sorrow, that I have no interest in the firm whose goods I mention. A. I. DOWLER.



EFFICIENCY — ECONOMY — ELEGANCE.

Models from 3½ to 8 h.p.
Catalogue with pleasure.
ZENITH MOTORS, Ltd.,
HAMPTON COURT, ENG.

EFFICIENCY is secured by correct mechanical design, careful choice of material, and skilful construction. All these you have in the Zenith, and, in addition, the infinitely variable Gradua Gear.

ECONOMY results from the maximum transmission of power to the road wheels, with a minimum of wear in the parts. Again, the Gradua Gear, which provides the right gear for every gradient, and the smooth transmission of the Longest-Belt-Drive, materially assist.

ELEGANCE of form and finish is apparent in the above picture: it is even more noticeable in the actual machine.

ZENITH

THE advantages and superiority of the Sturmey-Archer countershaft gear have been fully recognised by the War Office and it is owing to that recognition that we are unable to supply regular customers. Thousands are in use at the front and in England, giving daily proof that the

STURMEY-ARCHER SPEED 3 GEAR

can be depended upon under every condition. Why? Because there is fifteen years' experience of three-speed gear manufacture behind every Sturmey-Archer countershaft gear.

IT'S worth getting to know about now for the time when we shall be able to supply private needs. Meantime, practically every gear we can produce is being used for military purposes. Isn't this the very finest evidence of quality?

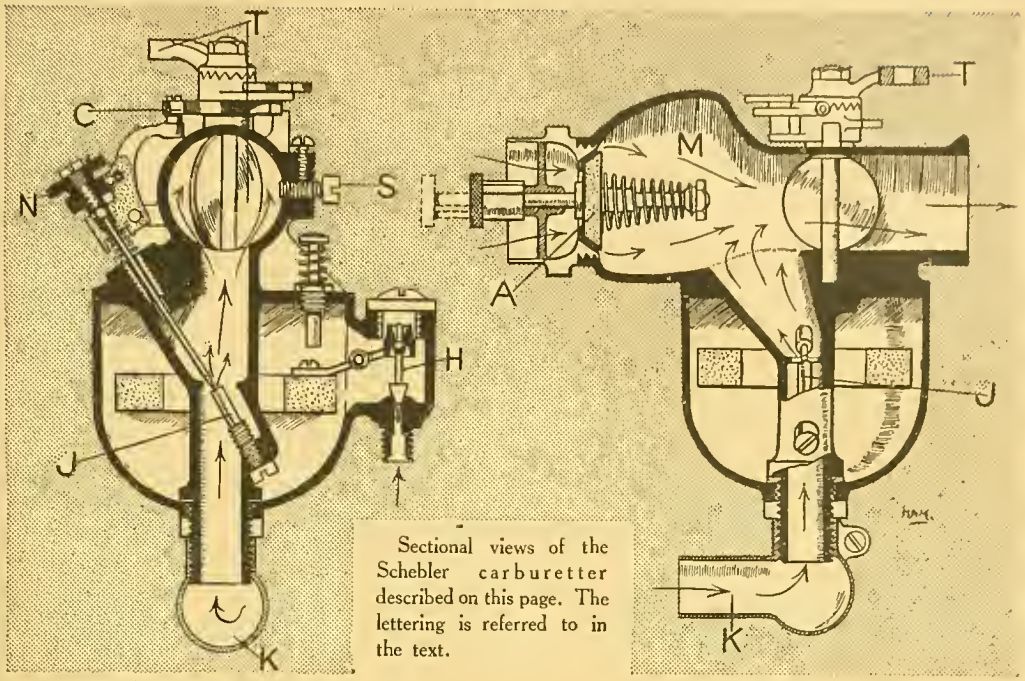
The Schebler Automatic Carburetter.

THE Schebler automatic carburetter is very popular in the United States, and it is found on many of the American machines imported to this country. Anyone who has ridden an American motor cycle so fitted for the first time will be struck by the extraordinarily smooth running and rapid acceleration. Moreover, he will be pleasantly surprised to find that when it is throttled down the engine will run slowly and regularly without missing fire. Many British machines, both twin and single-cylinder, suffer from this lack of flexibility, which is almost always due to an inefficiently designed carburetter. Thus we think that a description of the working of the Schebler and some hints on its adjustment will be appreciated by our readers. Outwardly the carburetter appears to be somewhat complicated, but a glance at the accompanying drawings will show that it is not really so. The method of working is quite simple, but there are numerous adjusting screws which allow the carburetter to be adjusted to any make of engine.

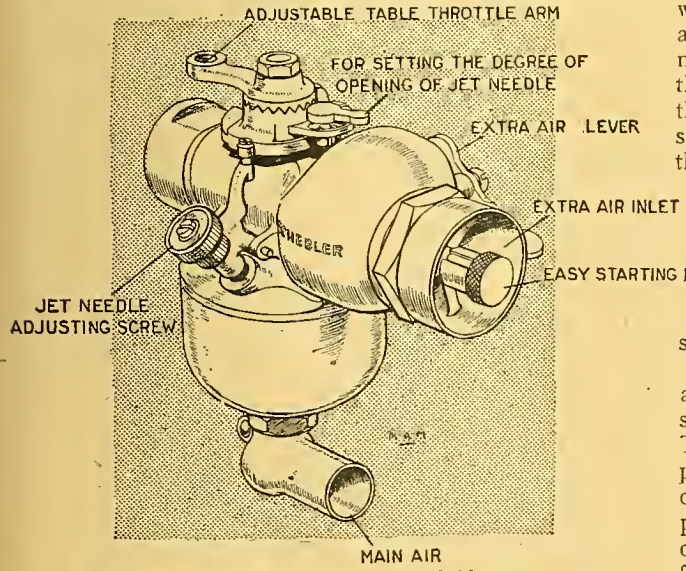


Sectional views of the Schebler carburetter described on this page. The lettering is referred to in the text.

Fig. 1. Fig. 2.

The float chamber works on the usual principle, but is rather peculiar in shape. It is shaped like a cup, and contains the annular varnished cork float, the needle valve H being in a separate chamber. The main air enters through the inlet K and rushes past the jet J, carrying the mixture into the mixing chamber M (fig. 2), where it receives an additional air supply through the automatic valve A. It will be seen, therefore, that there are very few moving parts.

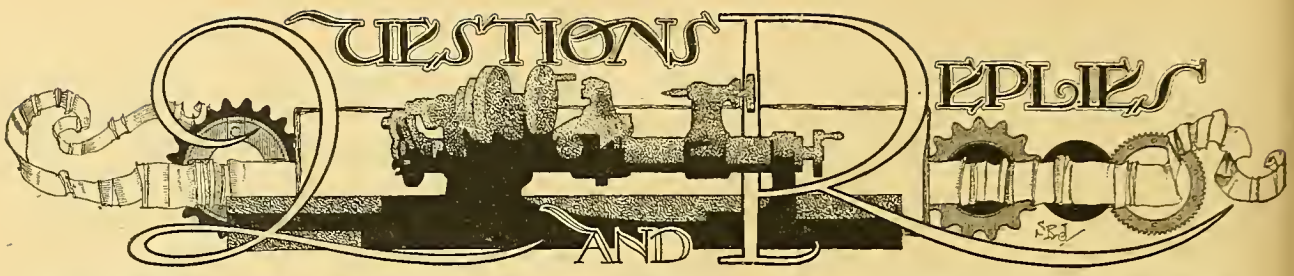
The chief ingenuity of the carburetter lies in the control. As the throttle T is opened, the needle valve N is lifted up from the jet by means of the cam C, so that more petrol is allowed to exude at high speeds. Delicate adjustment is provided by means of the screw, which permits the throw of the needle valve to be altered. The contour of the cam operating the jet needle may be altered by turning a pointer on the throttle mechanism from the figures 1 to 3. This has the effect of lowering the cam and reducing the petrol supply. Adjustment is also provided for controlling the pull on the spring of the extra air valve A by turning the knurled screw, clearly seen in fig. 2, while in the same figure the dotted line shows the position of the knurled screw when it is pulled out and turned round. This tightens the spring and prevents the valve from opening at low speeds, and thus gives a sufficiently strong mixture to render starting easy.



ADJUSTABLE TABLE THROTTLE ARM
FOR SETTING THE DEGREE OF OPENING OF JET NEEDLE
EXTRA AIR LEVER
EXTRA AIR INLET
EASY STARTING BUTTON
JET NEEDLE ADJUSTING SCREW
MAIN AIR

Fig. 3.—External view of the American Schebler carburetter.

It will be noticed that the throttle arm T is adjustable, so that this may be set at any angle to suit the convenience of the assembler of the machine. The screw S (fig. 1), which, it will be observed, is provided with a locking arrangement, provides a means of leakage past the throttle when closed, thus permitting slow running when the gear is in neutral or the clutch is out. An extra air lever is also fitted for use on very hot days.



A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, London, E.C., and whether intended for publication or not **must be accompanied by a stamped addressed envelope for reply.** Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of eovelope, and should be kept distinct from questioos bearing on technical subjects.

Re-magnetising.

I should be much obliged if you would tell me how to re-magnetise the magnets of a magneto. I have a dynamo that is used for lighting purposes.—J.D.

You require a powerful two-pole electro-magnet, and need to wipe the ends of the poles of the magneto magnets across these, being careful to apply similar poles to one another, otherwise, instead of magnetising the magnets, you will de-magnetise them. No special skill is necessary, and, if you draw the poles of the magneto across the poles of the electro-magnet about a dozen times, the magnetism will be improved.

Cover Blowing Off.

(1.) I have fitted a new (extra heavy) tyre on the back wheel of my 3½ h.p. motor cycle, 26in. × 2½in. for a 2¼in. rim. It blows off the rim, and, of course, bursts the tube. If I fit a security bolt opposite the valve, will it prevent it happening again, or will it be still more safe if I fit two security bolts? Up to now I have only used it solo. If I fit two bolts, should I space them out equally around the rim, counting the valve as one bolt? (2.) Is a cover more sure to remain on pumped hard than soft? (3.) Can the makers repair my new tube, which is also a 26in. × 2¼in., by fitting a new length in it, as it has a burst six or seven inches long? Is it worth it?—P.E.

(1.) The trouble may be due to the tyre being badly fitted, causing the tube to be nipped under the beads, which would cause the cover to blow off. If the cover is a fairly tight fit this is very likely to happen. In this case there should be no need for security bolts, though, in any case, you might use a "bolt valve." If, however, the cover is a slack fit, then two security bolts would undoubtedly be useful in addition to the bolt valve, and these should be spaced equally round the rim, taking the bolt valve as one. If the cover is a very slack fit it is possibly faulty, and it would be as well to consult the makers. (2.) It is safer to have the tyre blown fairly hard. (3.) Yes; it is quite satisfactory to have the damaged portion of the tube removed and a section let in. The manufacturers would do it, or any other good firm of tyre repairers. It would cost a matter of a few shilings.

Large versus Small Valves.

I should be much obliged if you would give me your opinion on a point that puzzles me. It is generally admitted that big valves make for efficiency, and many well-known makes have big valves. But one well-known make, on the other hand, is fitted with small valves in comparison with the others, yet it has put up some fine performances and has proved itself to be efficient. This make seems to be able to compete with any of the big valve machines, so where is the advantage of big valves? In theory, the small valve engine ought to be far below the rest in efficiency.—W.F.

The theory is that if large valves were fitted, the valves need not have such a big lift, consequently there is less wear on the valve mechanism. If small valves are fitted, the same results are obtained by giving a higher lift. You see that practically the same degree of efficiency can be obtained in either case.

Incorrect Mixture.

Please can you tell me what is wrong with my motor cycle? It is a 2½ h.p. two-stroke, with Senspray carburetter and Dixie magneto, fixed ignition. I have had it about three months, and have run about 1,300 miles. It has given every satisfaction until recently, when it started to splutter at the carburetter and then stop running, and I had to run with it for about fifty yards before it would start again. It would just run for a hundred yards or so and stop. I examined the jet and it was all right, also tested the plug and looked to the petrol pipe, looked in the tank to see that nothing was floating over the petrol outlet, and also examined the timing and found all correct. I raised the petrol level, and tried three different sized jets, 26, 28, and 30, but with no benefit. I had been running with a 30 jet until the machine stopped.—J.W.R.

The symptoms you mention certainly point to incorrect mixture. Make quite certain there are no obstructions in either the petrol pipe, carburetter passages, or jet. If these are all clear, then the trouble may be due to an air leak. Make sure all joints between the carburetter and engine are quite airtight, and also all the crank case joints, as in a two-stroke this is most important. You might also make sure that the vent in the petrol tank is clear and not causing an air lock. You should also make certain that the timing of the magneto has not slipped; the spark should take place when the piston is about ¼in. to ⅛in. from the top of the stroke. Examine the contact breaker and see that the rocker is not sticking, and that the points separate about ½ mm. Try a new plug; often a plug will spark out of the cylinder, but will not spark under compression.

High Petrol Consumption.

I have a 1911 2 h.p. fixed gear motor cycle fitted with a new Amac carburetter with 25 jet. I have had it a few months and it runs well, and will do all that I require as regards power. I have been told, however, that it ought to do at least 100 m.p.g., whereas I can only get 50 m.p.g. out of it. Would you kindly tell me if it is possible or worth while to get a machine of this age to do better? I am told that my engine is in very good condition, and it certainly pulls splendidly. It has an automatic inlet valve. Will that account for greater petrol consumption? I find that experimenting with the carburetter upsets the running, and I cannot yet get it to do better than 50 m.p.g. If you think it would be labour lost to try any further I will sell it and get a modern one, although I like the machine very well.—W.H.G.

Evidently there is something very wrong with your machine for you to get only 50 miles to the gallon. You should certainly do at least 100. As to where the leakage is taking place we cannot imagine, unless the petrol leaks from the float chamber; the needle valve requires to be ground in; there are leaks at the petrol pipe unions, or through the filler caps when you have the tank too full. Of course, the automatic inlet valve is bad for slow running, unless you have a very weak spring, and if you have a weak spring the petrol consumption would be greater than if you had a fairly strong one. Try fitting a slightly stronger inlet valve spring, and see if this will effect the desired improvement: also, by means of a washer, restrict the opening to about $\frac{3}{32}$ in.

SPECIAL NOTICE.—*Copies of "The Motor Cycle" may only be sent to neutral European countries if posted direct from the offices of the publishers, or by newsagents who have obtained permission from the War Office for this purpose. The publishers of "The Motor Cycle" have obtained the necessary permission, and, consequently, can send subscribers' copies as usual. Before sending through newsagents it is important to enquire if permission has been obtained, as otherwise copies intended for neutral European countries will not be forwarded by the Post Office.*

Misfiring.

[?] I am the possessor of a 1915 7-9 h.p. Harley-Davidson (electrically lighted model), and I want your advice about some trouble I am having. The trouble began with bad misfiring. This only took place when the engine was pulling hard. Then the horn went wrong, and I discovered that the fuse had gone. This was replaced, and now the engine goes with considerably less power than usual. I think there is a short circuit somewhere. The electric equipment is the Remy. Can you give any reason for this misbehaviour?—W.F.C.

When a misfire has been definitely proved to be due neither to the carburetter, valves, nor plug, you should look to the vacuum switch, breaking the circuit between the generator and the battery, which may not close at all speeds. The switch should close at the least suction, and then open as soon as the engine ceases to turn over. It is as important that the vacuum releases promptly, as it is that it closes as soon as the engine starts, and remains closed at all speeds. If this is not the case, the fault lies in the diaphragm, in the vacuum pipe, or in the check valve. The diaphragm leather may be so dry that the vacuum cannot be retained, in which case a few drops of good leather dressing, or castor oil, should be rubbed into the leather surface. The diaphragm should always be soft, pliable, and clean, but any excess of oil must be wiped off with a clean dry cloth. If it becomes oily and dirty the vacuum will not release quickly, and while the platina remain in contact the battery will discharge itself through the generator windings. If the switch is in order the check valve should be next inspected. This is a small tube fitting in the Y. piece connecting the vacuum pipe with the crank case. Disconnect the pipe and unscrew this tube, when it may be found that the ball is rendered inoperative through being gummed up with dirt or oil. The remedy is to squirt petrol through, and test the vacuum by drawing air through the upper end with the mouth. Should the switch and the check valve be in order, then one of the connections between the two may be leaking, a state of affairs easily remedied by drawing up the unions at one or both ends of the controller pipe. Should the trouble not then be found, it is possible that the contact breaker spring on the other side of the unit may have lost some of its tension, in which case the spring will have to be replaced. It should also be noted that the platinum points should be clean and the rocker arm working properly.

Chain Stretch.

[?] (1.) I have just purchased a 1915 3 h.p. twin, and after running only sixty miles I find that the tension of the driving chain varies considerably as the back wheel is rotated. The sprockets are truly central, both on the back wheel and on the countershaft, and are properly lined up. There are no broken bushes on the chain, and, naturally, no appreciable wear on the chain or sprockets. The back wheel is set squarely in its forks. Can you suggest what has caused this, and is it serious? The sag varies from about ¼in. to ⅜in. in the middle of one side of the chain. (2.) Is there any rough test to determine whether the engine is overheating? For example, should a piece of paper held against the cylinder flanges show signs of being charred? By the time "knocking" commences things have usually gone too far. (3.) Is a speedometer designed for a 26in. wheel with 2in. tyres equally suitable for a 26in. × 2¼in.? I have been told that the diameter of the rim is adjusted so as to make the overall diameter of the tyre the same in each case.—C.

(1.) The trouble with your chain appears to be due to uneven stretch, causing the chain to mount the sprockets slightly at intervals. This should not happen in so short a distance, so probably the chain is a faulty one, in which some of the rivets are soft. You should return it to the makers to be tested. The only other possible cause of the trouble would be either worn or eccentric sprockets. You must adjust the chain so that it is not too tight at the tightest point. Unless the chain is so slack that it jumps off no damage will be done by running it in this condition. (2.) There is no method of testing whether an engine is overheated. The temperature which will give bad running on one machine would possibly have little or no effect on another. The only way of knowing is when poor running or knocking occurs. If an engine is running reasonably cool you should not be able to light a safety match by placing it on the cylinder head or valve pockets. It is possible that paper would be scorched if placed on the cylinder of a motor running even reasonably cool. (3.) Yes; a speedometer may be used just the same with either 26in. × 2in. or 2¼in. wheels, there being so slight a difference in the overall diameter as to make very little difference in the accuracy of the instrument. If the 2¼in. tyre were run slightly slack it would probably be sufficient to overcome the difference.

EXPERIENCES WANTED.

Readers desirous of obtaining the experience of others with various motor cycles or accessories must enclose a stamped addressed envelope in which the replies may be forwarded. Answers to the queries should be addressed c/o The Editor.

"V.C.R." (Birmingham).—Water and air-cooled Blumfield engines.

"B.F.R." (Birmingham).—2¾ h.p. de luxe T.D.C. Reliability and capability for sidecar work. Also Grado pulley.

RECOMMENDED ROUTES.

UPPINGHAM TO BRADFORD.—R.G.F.

Uppingham, Oakham, Cottesmore, Grantham, Newark, Tuxford, Retford, Doncaster, Wakefield, Bradford.

BATH TO MUMBLES.—J.P.P.

Bath, Chipping Sodbury, Iron Acton, Pilning, by train to Severn Tunnel Junction, Newport, Cardiff, Cowbridge, Bridgend, Aberavon, Neath, Morriston, Swansea, Mumbles.

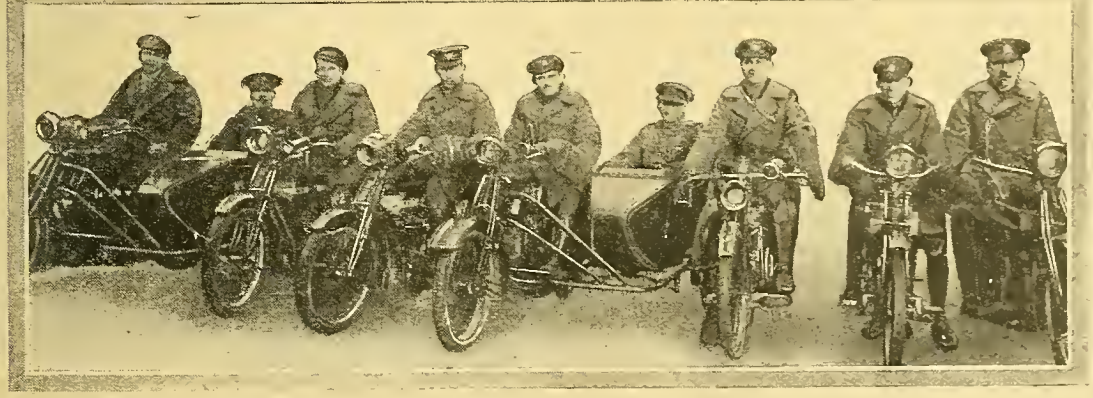
LEDBURY TO BYFLEET.—C.R.N.M.

Ledbury, Tewkesbury, Coombe Hill, Cheltenham, Cirencester, Fairford, Lechlade, Faringdon, Wantage, Streatley, Pangbourne, Reading, Wokingham, Ascot, Virginia Water, Chertsey, Byfleet.

ILKLEY TO AMBERGATE.—L.Le M.

Route avoiding Sheffield.—Ilkley, Bradford, Huddersfield, Lockwood, Holme, Langdon Dale, Glossop, Chapel-en-le-Frith, Buxton, Bakewell, Matlock, Ambergate. Nearest Route.—Huddersfield, Penistone, Sheffield, Bakewell, Matlock, Ambergate.

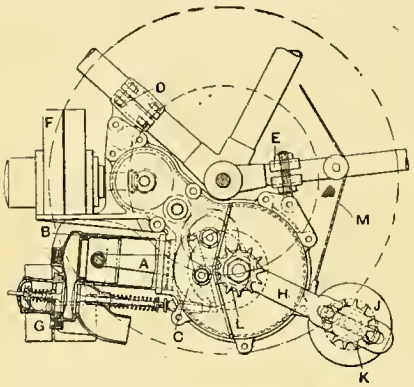
MOTOR CYCLISTS ATTACHED TO AN AMMUNITION PARK IN FRANCE.



Reading from left to right: Pte. J. Blanks and Q.M.S. J. Baxter (Clyno sc.), Lance-Corpl. J. Betts (B.S.A.), Lance-Corpl. H. Thacker (B.S.A.), Pte. F. C. Lander and Sec.-Lieut. R. B. Clark (Clyno sc.), Pte. J. Rice (Douglas), Pte. C. Maidens (B.S.A.), and Pte. J. Cain (Clyno sc.). We have to thank Sec.-Lieut. Clark, a prominent member of the Motor Cycling Club, for the original photograph.

An Auxiliary Driving Set.

The complete driving set is arranged beneath the bottom bracket of a pedal cycle, and is sufficiently narrow not to interfere with the rotation of the pedal cranks. The connecting rod A in the cylinder B drives on to an eccentric C, affording a narrower construction than would be the case an ordinary crank were used. The engine is supported by

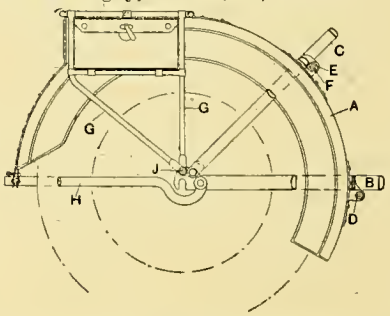


clips D E, whilst the magneto is shown at F and the carburetter at G. Mounted co axially with the eccentric C are arms H, the lower ends of which afford a bearing for a wheel J driven by the chain sprocket K from the engine sprocket L. A cable M is employed to draw the wheel J into contact with the rear wheel tyre for driving purposes.—S. Dorsett and G. M. Brunton, No. 24,485, 1914.

PATENTS by Eric W. Walford

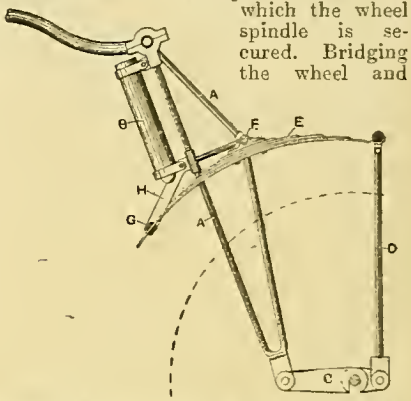
A Detachable Rear Mudguard.

Attachment of the mudguard A to the chain stays B and saddle stays C is effected by lugs D E, which engage brackets on the stays and are secured in position by bolts F. The guard A is further supported by the frame G of the luggage carrier, and a spring clip at the rear end supports the stand H. By removing the bolts F and also the studs J, by which the luggage carrier is attached to the fork ends, the complete guard and carrier can be easily detached. —G. E. Rigby, No. 19,963, 1914.



A Cantilever Spring Fork.

The employment of cantilever springs in the suspension systems of vehicles is increasing in popularity, and their adoption for the front forks of motor cycles is being suggested. In the instance shown, the main girder A is rigidly attached to the steering pillar B, and carries at each side a pivoted link C in which the wheel spindle is secured. Bridging the wheel and



ensuring that the side links C always move in unison is an arch member D, to which the front end of the cantilever spring E is attached. The spring is duplicated on each side of the girder A, and the centre is attached at the point F, whilst the rear end passes through a guide G carried by an arm H. The specification mentions that the links C may, if preferred, extend backwards instead of forwards, as in the drawing.—G. E. Bradshaw, No. 24,191, 1914.

Coro Tyre Repair Outfits.

Among the long and varied list of oil, rubber, and other goods for the motorist sold by the Coro Oil and Rubber Co., Ltd., of Aston, Birmingham, attention is drawn to the tyre repair outfits. Great care has been expended in both manufacturing of the contents and the case itself; for example, the patches are contained in special clip pockets.

Catalogues Received.

Enots Automatic Drip-feed Lubricator with Auxiliary Pump; Messrs. Benton and Stone, Ltd., Birmingham. This booklet gives full information concerning the working of the Enots automatic drip-feed with auxiliary pump, and also particulars of a crank case relief valve.

B.S.A.—The Birmingham Small Arms Co., Ltd., Small Heath, Birmingham. The 1916 catalogue is a fine production, and the three-colour plates of the complete machines are very pleasing. The latter are accompanied by full specifications of the models they illustrate, and other pages are devoted to illustrating and describing the many detail features and refinements possessed by the B.S.A.

The Enfield Cycle Co., Redditch, have issued a new edition of "The Book of the 6 h.p. Enfield." This contains full instructions for the use and care of this popular model, and a complete list of spare parts (with latest prices). We would especially draw attention to the valve timing diagrams on page 22. A copy of this booklet will be sent gratis to any owner of a 6 h.p. Enfield who asks for one, giving the number of his machine.

SPARKLETS

Tyre Repair Outfits for War Office.

We are advised that the Government has recently placed with the County Chemical Co., Ltd., of Birmingham, what is possibly the largest contract for tyre repair outfits to War Office pattern ever given, covering as it does twelve months' supplies.

All-weather Capes.

Some misunderstanding may have been caused in the reference on page 488 of November 18th to the Rogan capes by the address of the makers being given as Mottington, Manchester, and Withington, Manchester. The latter is the correct one.

A.J.S. Machines in London.

Messrs. H. Taylor and Co., Ltd., 21a, Store Street, Tottenham Court Road, W.C., will be showing during the present week a range of all A.J.S. motor cycles, together with sections of working models of the detachable wheel, and showing the methods of lubrication in vogue on these engines. An A.J.S. fitted up with Lucas dynamo set will also be on view. This exhibition will be open each day from 9 a.m. to 8 p.m. until Saturday, December 4th.

Fire at Howes and Burley's Premises.

A portion of the works of Messrs. Howes and Burley, Ltd., lamp manufacturers, of Birmingham, was seriously damaged by fire in the early part of last week.

A Manchester Agency.

Mr. E. Woods has taken over the sole control and management of the W. and H. Motor Co., of 287, Deansgate, Manchester. The firm handle several well-known and important motor cycle agencies.

American Simms Magnetos.

The capital stock of the Simms Magneto Co., of East Orange, New Jersey, has recently been increased. The works have been considerably extended, and the firm is very busy on the production of magnetos, etc.

Buying Inexpensive Tyres.

Motor cyclists are often chary of buying tyres and tyre accessories at greatly reduced figures, and we may say that in most cases they have good reason. The Elite Rubber Co., Ltd., 260, Vauxhall Bridge Road, Victoria, S.W., however, inform us that the goods they offer are quite new and in perfect condition. They also point out that they have purchased Continental tyres under the supervision of the Board of Trade, and the money paid for them is held in trust by the Board of Trade authority. It is, therefore, not unpatriotic to purchase these German covers, as it is obviously more beneficial for the Government to hold money in trust than goods of a more or less perishable nature.

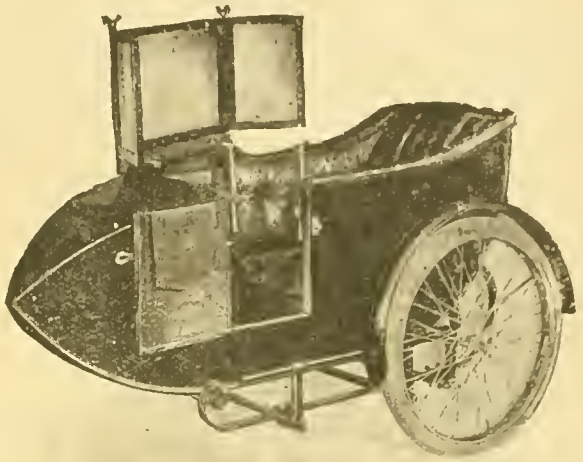
DUNHILLS PATENT TRIPLE WINDSCREEN

Provides extreme comfort for WINTER RIDING.

AN ideal windscreen—keeps the passenger always snug and cosy in the coldest weather, and free from draughts.

The side wings are detachable, and the screen can be tilted to any angle. It will fit any make of car.

A twist of a wing nut is sufficient to release the catch and let the screen swing across and allow the passenger to alight.



In Polished Walnut with Nickel Fittings:

Price complete with side wings - - £3 0 0
Price of Single Screen - - - - £2 2 0

Dunhills LTD.,

359-361, EUSTON RD., LONDON, N.W.
—42-43, LOMBARD STREET, E.C.—

GLASGOW: 72, Vincent Street.

"FORWARD" BRITISH MADE ACCESSORIES

TYPE TT. 3/-

INSIST on Forward British plugs for best results.

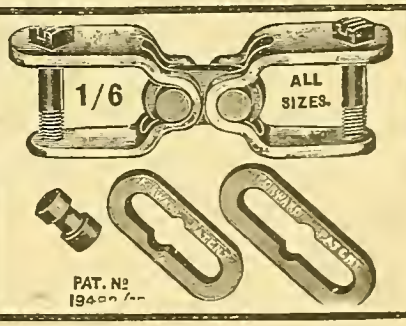
Made in a dozen types.

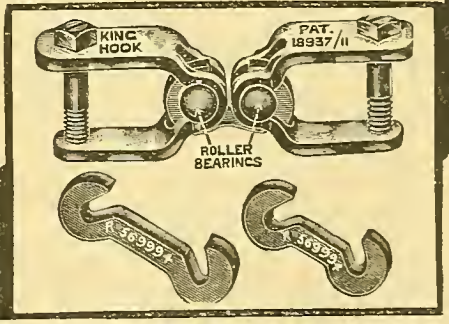
"FORWARD" adjustable belt fastener with the unbreakable links and roller bearings.

Made in all sizes and sold by all agents.

1/6 each.

Forward Leather Link 1/- each.





"KING HOOK" the strongest hook fastener in the world.

Fitted with double strength hooks, roller bearings and unbreakable screws.

1/- detachable. 1/3 adjustable.

King Hook Leather Link **10d. each**

FORWARD MOTOR CO., Summer Row, BIRMINGHAM.

MISCELLANEOUS ADVERTISEMENTS.

PRICES.

ADVERTISEMENTS in these columns —First 12 words or less 1/6, and 3d. for every two words after. Each paragraph is charged separately. Name and address must be counted. Series discounts and special terms to regular trade advertisers will be quoted on application.

Postal Orders sent in payment for advertisements should be made payable to ILIFFE & SONS Ltd., and crossed & Co.

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Hertford Street, Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," Coventry, or London (20, Tudor St., E.C.), by the first post on Friday morning previous to the day of issue.

All letters relating to advertisements should quote the number which is printed at the end of each advertisement, and the date of the issue in which it appeared.

The proprietors are not responsible for clerical or printers' errors, although every care is taken to avoid mistakes.

NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, the sum of 6d. to defray the cost of registration and to cover postage on replies must be added to the advertisement charge. Only the number will appear in the advertisement. Replies should be addressed, "No. ooo, c/o 'The Motor Cycle,' Coventry"; or if "London" is added to the address, then to the number given, c/o "The Motor Cycle," 20, Tudor Street, E.C.

☞DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt.

The time allowed for a decision after receipt of the goods is three days, and if a sale is effected we remit the amount to the seller, but if not we return the amount to the depositor, and each party to the transaction pays carriage one way. For all transactions exceeding £10 in value, a deposit fee of 2s. 6d. is charged, when under £10 the fee is 1s. All deposit matters are dealt with at Coventry, and cheques and money orders should be made payable to Iliffe & Sons Limited.

The letter "D" at the end of an advertisement is an indication that the advertiser is willing to avail himself of the Deposit System. Other advertisers may be equally desirous, but have not advised us to that effect.

SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

DEFENCE OF THE REALM ACT

Under the provisions of the above Act, advertisers requiring workmen, and whose business consists wholly or mainly of engineering or the productions of munitions of war, or substances required for the production thereof, and whose works are situated within 30 miles of London, must include in every such advertisement the words, "No person resident more than 10 miles away, or already engaged on Government work, will be engaged."

Advertisers whose works are situated more than 30 miles from London can only have their announcements inserted with the approval of the Board of Trade, who will allocate to each advertisement a box number, and collect and distribute to the advertiser all replies received. The necessary forms of application can be obtained from any Labour Exchange or from the offices of this paper, and each advertisement must contain a clear reference to the effect that no person already engaged on Government work need apply.

MOTOR CYCLES FOR SALE.

Miscellaneous.

WANDSWORTH Motor Exchange, London's leading motor cycle firm; greatest bargains ever known; exchanges.

WANDSWORTH.—Clyno, 1915, 2½h.p., 2-stroke, mag., little used, mostly soiled; £32/10; exchanges.

WANDSWORTH.—Hobart, brand new, 2½h.p., 2-stroke, just delivered from works; 28 gns.; exchanges.

WANDSWORTH.—Rudge, 1915, new, 3½-4h.p., mag., 3 speeds, magnificent machine; £52/10; exchanges.

WANDSWORTH.—American Excelsior 1914½ coach combination, 7h.p., 2 speeds, speedometer; £58/10; exchanges.

WANDSWORTH.—Williamson 1914 coach combination, 8h.p., Bosch, water-cooled, Cowey; £59 10; exchanges.

WANDSWORTH.—Indian 1914 combination 7h.p. Bosch, 2 speeds, speedometer, beauty; £58/10; exchanges.

WANDSWORTH.—F.N., 1913, red, 5-6h.p., Bosch, 2 speeds, fine machine; offers; exchanges.

WANDSWORTH.—Humber, 1913, 3½h.p., mag., 2 speeds, beautiful order; cheap, £32/10; exchanges.

WANDSWORTH.—Sunbeam, 1915, new, 3½-4h.p., mag., 3 speeds, countershaft; offers; exchanges.

WANDSWORTH.—Bradbury coach combination, 4h.p., Bosch, 2 speeds, nice order; £32/10; exchanges

WANDSWORTH.—Premier, 1914-15, 3½-4h.p., mag., 3 speeds, kick, nearly new; 38 gns.; exchanges.

WANDSWORTH.—Sun-Villiers 1915 2-stroke, mag., only soiled; bargain, £25/10; exchanges.

WANDSWORTH.—James 1915 2-stroke, mag., 2 speeds, Cowey, as new; £36/10; exchanges.

WANDSWORTH.—Rover, 1914, 3½-4h.p., mag., 3 speeds, clutch, beautiful order; offers; exchanges.

WANDSWORTH.—Abingdon, 1915, 3½-4h.p., mag., only ridden few miles; sacrifice, £28/10; exchanges.

WANDSWORTH.—Lady's Hobart, 1913, 2½h.p., Bosch, 3 speeds, practically new; £23/10; exchanges.

WANDSWORTH.—Humber, 1913, 2½h.p., mag., only wants seeing; cheap, £17/10, exchanges.

WANDSWORTH.—F.N., 1912, 5-6h.p., with sidecar, multi clutch, speedometer; gift, £26/10; exchanges.

WANDSWORTH.—Easy terms.—Wandsworth Motor Exchange, Ebner St., Wandsworth Town Station. 'Phone: Battersea 327. [X5659

MORGAN and Maxwell, the London Motor Mart, 80, High Rd., Streatham, London, offer the following amongst many other bargains:

M. and M.—A.C. Sociable, 6h.p., mag., hood, screen; £30.

M. and M.—Bat-Jap, 3½h.p., Bosch; £16.

M. and M.—Bat, 5-6h.p., 1914, 3 speeds, chain-combelt, as new; £50.

M. and M.—Bradbury, 1913, 3 speeds; £25.

M. and M.—Two Clynos, 2½h.p., 1914; cheap.

M. and M.—Imperial-Jap, 2½h.p., 1915, as new; £38.

M. and M.—Matchless-Jap, 3½h.p., Mabon; £18.

M. and M.—Moto Reve 2¼h.p. Lightweight; £10.

M. and M.—N.S.U. 3h.p. Twin, 1912, Gradua gear, lamps, etc.; £17.

M. and M.—Royal Enfield, late 1914, 6h.p., combination, lamps, etc.; £62.

M. and M.—Sun-Precision, late 1913, 2½h.p.; £18.

M. and M.—Triumph, 1909, 2 speeds, sidecar, lamps, etc.; £30.

M. and M.—Triumph, late 1912, and sidecar, 3 speeds, £34; also several Triumphs.

M. and M.—Wall cycle car, 2-seat., 1913; offers

M. and M.—Win-Precision, 3½h.p., fine order; £24.

M. and M.—Wooler, 1915, 2¾h.p., 2-stroke, as new, variable gear, patent springing, etc.; £40.

MORGAN and Maxwell have also a 1915 American Excelsior, a 1912 3-speed Rover, a 1914 Triumph, and many others; over 100 in stock. Cheapest and best in Great Britain. Write or call immediately.—The London Motor Mart, 80, High Rd., Streatham, London. [X5592

Fittings on American Motor Cycles.

THE American nation has a reputation for smartness, but the American manufacturers who are endeavouring to obtain a footing in this country seem extremely loth to conform to Britishers' ideas. These remarks do not so much apply to the larger firms, who are endeavouring to meet the wants of the British motor cyclist, but certain of the newcomers are somewhat slow in realising how our tastes differ from those of the American. Almost without exception, the motor cycles which come from the United States are provided with filler caps of a size which was heartily condemned on all sides over here four or five years ago. Another favourite error is practically to ignore the existence of the sidecar. The sidecar has not yet attained in the United States anything like the popularity which it enjoys in this country, and perhaps this accounts for the fact that many twin-cylinder machines are sent over here with 3½ to 1 gears for sidecar work. The hand-controlled clutch is satisfactory as far as it goes, but surely it would be very much better to control the clutch by means of a Bowden lever on the handle-bar, a method which does not necessitate the driver removing his hand from one of the handle-bar grips. There are many points which we greatly admire in American motor cycles; for instance, the mechanical system of lubrication, which practically relieves the driver of any anxiety or worries on this score; the excellent steering, and carburetters giving wonderful controllability; but points such as those we have mentioned above certainly need attention. The handle-bar twist control is exceedingly fascinating to those who are accustomed to it, but we are quite sure that the English rider, if given the choice, would infinitely prefer the handle-bar lever. We are well aware that in large factories where everything is standardised, any alteration entails a certain amount of expense, but when a foreigner wishes to popularise his products in a strange country he must be prepared to make some small sacrifice to suit the whims and fancies of its inhabitants.

Cooling Valve Caps.

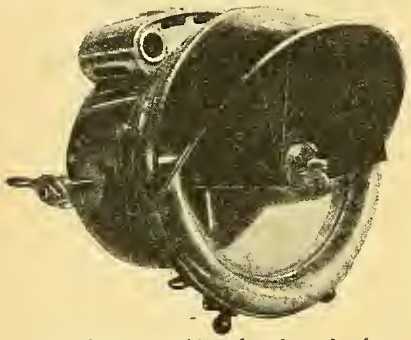
IN the attempt to extract the maximum amount of power from an air-cooled engine, such points as solid masses of metal as are contained in the valve cap must receive attention in the matter of cooling, and it is really surprising that designers have not already standardised some form of cooling for valve caps, as the plain metal must be a point at which heat is harboured to the detriment of the plug which it holds, and the valves directly below. When Tourist Trophy Races and other strenuous tests are on the *tapis*, it is quite usual to see valve caps fitted with a cooling tower composed of a hollow rod with radiating fins to dissipate the heat, and it is usual for fitments which have been proved to be efficient in the races to be adopted subsequently on touring mounts, but so far as a valve cap cooling device is concerned, nothing has been done. Confident in the belief that an improvement in the running and a prolongation of the life of plugs and valves would result as a consequence of efficiently cooling the valve cap, we have collected together and published in this issue illustrations of the different valve cap cooling devices which have so far seen the light of day. Finally, as is usual in discussing such problems, we may turn to the experience of car and aero engine manufacturers, where it has been found that by adopting a water-cooled cylinder head, minus valve caps, the plugs which are contained in the cylinder head, and consequently efficiently water-cooled, give no trouble at all. Valve troubles, too, are practically unknown. Improvement in running can directly be ascribed to the complete and even cooling of the hottest parts of the engine, viz., the cylinder heads, by the elimination of valve caps

An Index to the advertisements in this issue will be found on the page facing the back cover

AMONG THE ACCESSORIES.

AN INGENIOUS LIGHT DIMMING METHOD.

A SOUND device for reducing the glare of a head light has lately been brought out by the Simplex Lamp Dimmer Co., 52, Gray's Inn Road, W.C. It consists of a small threaded spindle, provided with a substantial boss, which is fixed by means of cement to the centre of the front glass



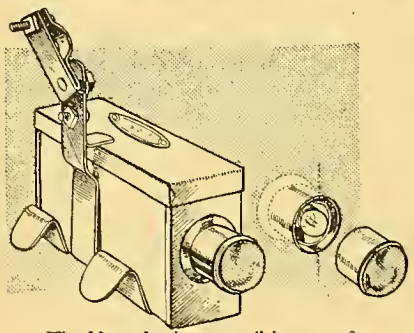
Lamp dimmer working after the style of a lady's fan.

of the lamp. Several segments of mica are next placed in position, the whole being held by a wing nut and washer.

The lamp is shown with the light half dimmed. When it is desired to use practically the whole power of the lamp, the segments are closed up together and placed in a vertical position by undoing the wing nut. Any degree of light can be obtained, or, if it be desired, the segments can be placed in such a position that the whole front glass is obscured. The idea is good, and the outfit is sold complete with cement for sticking on the central spindle, cotton-wool for cleaning the glass, and full instructions for fitting and finding the centre of the front glass. It is suitable for almost any lamp.

A BATTERY TAIL LAMP.

WE illustrate herewith an ingenious dry battery and tail lamp sold by A. H. Hunt, 115, Cannon Street, E.C. The two hooks in the casing are designed to fit on to the



The Hunt dry battery tail lamp outfit.

chain stays, while one clamp fits round one of the back forks. The little bulb holder, if turned to the right, acts as a switch, and switches on the lamp. It will be noticed that the cover may be removed and the lamp used for inspection purposes, as by undoing one screw it can be easily detached from its bracket. The lamp is certainly ideal for use by riders who use their machines for short night runs.

GROSE SPECIALITIES.

THERE have been numerous pillion seats introduced upon the market of recent years, but we have seen few more ingenious than that lately brought out by James Grose, Ltd., 4, Old Jewry, E.C. The seat may be either placed lengthwise on the carrier, in such a position that it would be suitable to be used by a boy, while if it is desired to carry a lady the seat can be placed round the other way—that is to say, transversely. The back is adjustable, and, moreover, can be folded away simply by first lifting it up, and then allowing it to fold down.

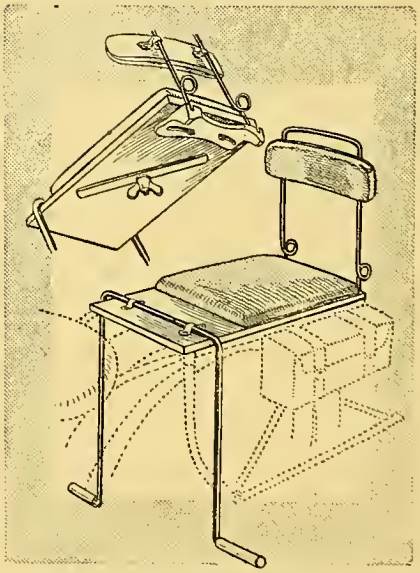
A moderately priced sparking plug sold by J. Grose, Ltd.

Messrs. Grose have also introduced a tyre accessory known as the Tiresaver, which is designed to assist a motor cyclist to return home even if the cover has burst at the bead. It consists of two steel plates, of which the smaller goes inside the cover and the larger outside. The two plates are fastened together by driving bifurcated rivets through them. The head of the rivet, however, must be inside the tyre.

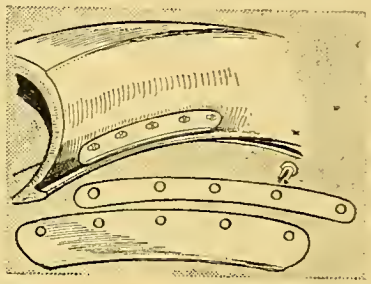
We also inspected on the occasion of our visit to Messrs. Grose's premises a sparking plug, which is sold at a very moderate figure (1s. 6d.). It is well finished, has a steatite insulator, and the electrodes are of substantial design.

Of other accessories may be mentioned a sidecar cover, made of rainproof material. This cover may be made to any pattern supplied by the purchaser, and is excellent value.

The firm is also making a speciality of remaking slightly worn tyre covers. The process includes strengthening and vulcanising on a 24 oz. rubber-studded tread.



The Grose two-position pillion seat.

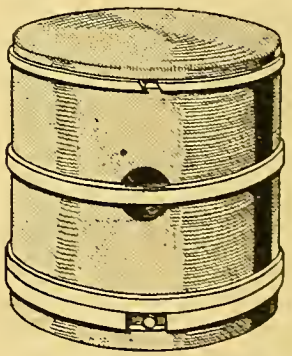


Grose's "Tiresaver," a device for temporarily repairing bursts at the beads of outer covers.

A SCRAPER PISTON RING.

IN order to prevent the oil working past the rings and reaching the piston top where it would burn and form carbon deposit, a novel piston ring has been patented by Jack Marshall, the old Triumph rider, after successful experiments on a 1906 Triumph extending over a period of two years.

In the sketch the ring is shown at the bottom of the piston, but the position is unimportant. The construction of the



Piston fitted with new type of ring patented by the former Triumph racing motor cyclist, Jack Marshall, who won the T.T. in 1908.

device is as follows: Fitting into the groove, which is deeper than usual, is a broad, thin ring with an ordinary diagonal cut. Over this ring two more rings are fitted, one above the other, and held in position by pegs driven into the inner ring; the two outer rings have straight cuts, and are, therefore, cheap to manufacture. On examining a piston so fitted, which we were told had been in use for a lengthy period, we found scarcely any trace of carbon.

OCCASIONAL COMMENTS

By 'Ixion'

Softening Copper-asbestos Washers.

Every practised rider knows that a few thousand miles of heat and compression render a copper asbestos washer leaky. Its elasticity can usually be restored by heating it red-hot and cooling it off in water; and I personally never scrap such a washer, especially in the larger sizes, without first annealing it afresh and seeing it is not fit for a further spell of active service. I find these washers harden much more rapidly than is desirable; and, wherever possible, I scrap them, and make the compression joint with fish glue or seccotine, or graphite jointing paste. Still, their use is practically inevitable for sparking plugs and compression taps at any rate; and here the tip is to fit new washers or to re-anneal the old washers at very frequent intervals.

"Some" Sidecar!

The other day I was waiting for the gates to open at a level-crossing when I noticed something quaint about the appearance of a sidecar just ahead, and dismounted to investigate. It consisted of a modified 7-9 h.p. Matchless with a two-seated tandem type sidecar attached. The sidecar was almost longer than the bicycle, and contained roomy accommodation for two big men, plus a huge luggage box astern and a windscreen in front. This unwieldy combination was fitted up to be driven from the front seat in the tandem sidecar, the well of which contained pedals for operating the clutch and brakes. The oil pump was operated by an inverted Bowden brake lever on the near grip; the steering was performed by a bent bar fastened to a crosspiece joining the ordinary handle-bars, and carrying the carburetter and magneto controls; the gear lever had been adapted for the driver's position by brazing a short horizontal tube and knob to project inwards at right angles. All the special fittings were readily detachable, so that five minutes' work with a spanner enabled the owner to drive from the saddle, leaving the fore tandem seat to be occupied by a *tertium quid*. The owner remarked that he found the cumbrous outfit extremely handy, and thought nothing of taking it across London.

Delivery Tune.

I suppose I must be indulgent towards the trade in war time, but really the condition of a "baby" two-stroke which was delivered brand new to a friend of mine last week has dried up the venom in my inkstand. The tank, as usual, was full of small brass oddments and filings, and the carburetter flooded freely through the needle valve getting jammed open until the solid particles had all been drained from the tank. Beneath the float, and threaded round the needle, was a short length of brass tubing, presumably employed by assemblers as a level gauge, which also had to come out before the needle could possibly cut off the supply of spirit to the jet. The engine had apparently never been run at all; two strong men laboured with it for an hour before getting an explosion, and when it at last fired it was so stiff that it had to be kept on low gear with copious injections of oil before it showed any inclination to two-stroke or even to pull. Still, it is war time; and we have less excuse to grumble when we are left to do our own tuning, and we must try to be grateful that we can get anything through at all. I really publish this grumble because the firm in question—and others—are supplying a few machines to the military, and I wish to do all I can to save them from similar annoyances. By the way, I noticed an unpardonable *bêtise* in the way of design on this little jigger; the petrol pipe passed within half an inch of the tip of the right-hand footboard, so that a little clumsiness with the toe would be bound to *strafe* it badly. Also the machine was delivered minus tyre pump, tyre repair outfit, and oilcan. Surely these three items should figure in every standard outfit

Agents as Manufactures.

In the pre-war days there was little scope for a repetition of the old push-bicycle practices, whereby a provincial agent bought parts from the big component factory, and made up a really decent machine under his own transfer. I have found a few motor cycle agents who build up a good engine, *e.g.*, a J.A.P., into a good frame, *e.g.*, a Chater Lea, decorating it with various proprietary fittings to suit their own notions or the tastes of their customers; but the practice has never been extensive. Now that the quondam flood of new machines emerging from our factories has dwindled to a thin and uncertain trickle, there is a gaping opportunity for the smart agent, and I wonder that our columns are not full of advertisements from small traders, eager to fill up the winter months by turning out "own transfer" machines for machineless enthusiasts. There are plenty of small repair shops, owned and run by men long past military age, whose staff still includes one or two smart youths under the enlistment age, and I have no doubt at all that the demand exists. Of course, conditions are less favourable for adapting this idea to the motor cycle trade, for the simple reason that few men run a motor cycle to destruction, and that the depreciation on an unknown make of machine is heavy, even if all the components are first-class. For example, whereas a carefully kept Triumph need not depreciate more than 20-25% in its first season, an equally costly multi-speeded 3½ h.p. bearing some such local transfer as the "Buckingham Blizzard" would probably not fetch more than 60% of its original cost at the end of its

Occasional Comments.—

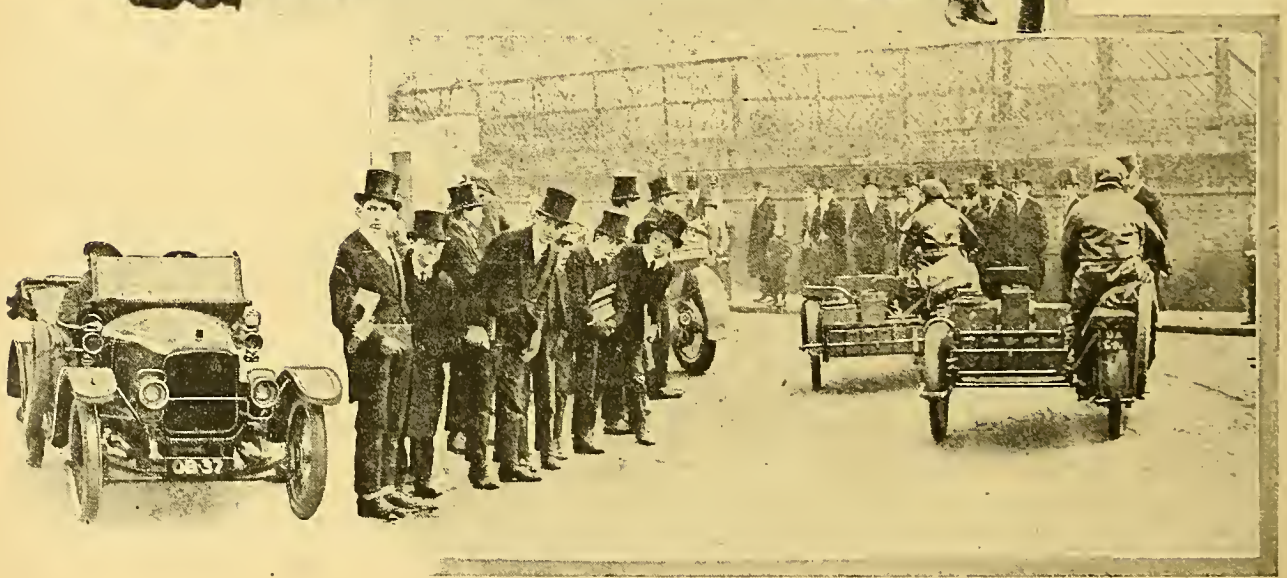
first year. Nevertheless, the demand so far exceeds the supply, that the agents could be sure of effecting sales.

Duplex Lubrication.

The James two-stroke, which does all my short work nowadays, has "petroil" lubrication for the cylinder, assisted by pump-feed for the main bearings and big ends. The double system is unquestionably admirable so far as durability goes, but seems to suggest that the babies are almost as extravagant in oil as some of them are in petrol. Oil is, naturally, cheaper than new bushes, and the single system, whether "drip" or "petroil," as adopted by many makers, does not always conduce to the longevity of the bearings. But my present oil consumption is too high when contrasted with automobile practice. Allowing a gallon of petrol per 100 miles, which is more than I can get on heavy winter roads, but should be possible in summer, the cylinder sucks in four ounces of oil *via* the carburetter; meanwhile the engine bushes take twenty pumps of oil direct. I have not measured the pump charge, but it is at least two ounces, more probably three. Putting it at the lower figure, the two-stroke consumes forty-four fluid ounces of lubricant in 100 miles.

Government Control.

It is by no means certain that the scheme by which part of the output of factories under Government control was to be released for normal purposes will come to early fruition. For example, I have had a machine on order for some months past, and when the makers wrote to tell me it would arrive this week, I replied that I had plenty to ride just now, and if they liked to send my jigger to some less fortunate rider I should be perfectly satisfied to wait till the spring for another. Their answer was that I had better collar it while it was available, as goodness only knew when they would be able to get another batch through. *Verb. sap.*



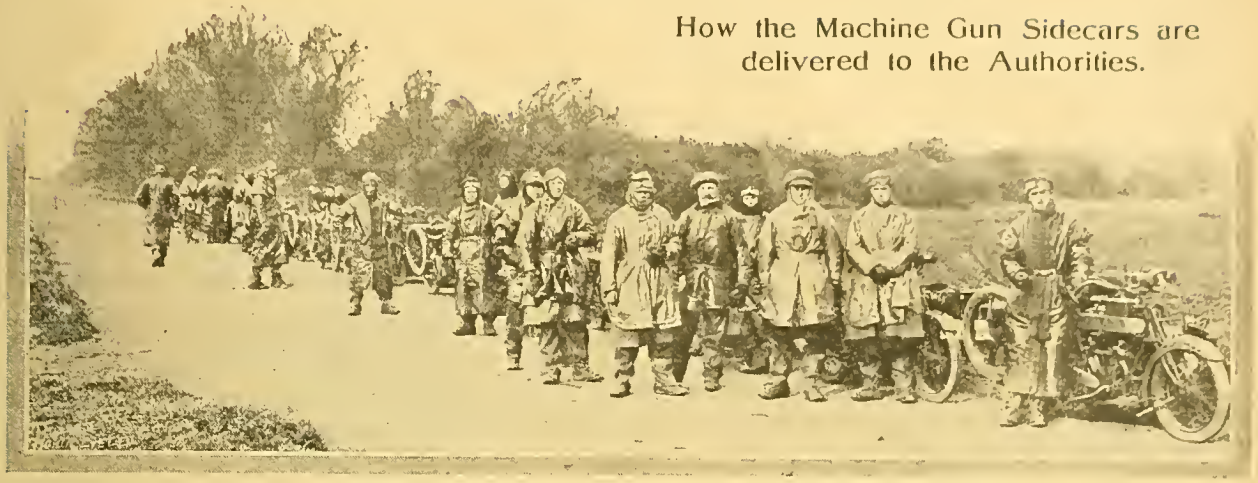
FROM WORKS TO ARMY.

In no places *en route* from Wolverhampton to the M.M.G.S. training centre do the motor machine gun sidecar outfits attract more interest than at Oxford and Eton. The car shown on the left is a Vauxhall, driven by Mechanical Transport Inspector Lieut. Stavers, who is bringing up the rear of the machine gun convoy.

(See opposite page.)

FROM WORKS TO ARMY.

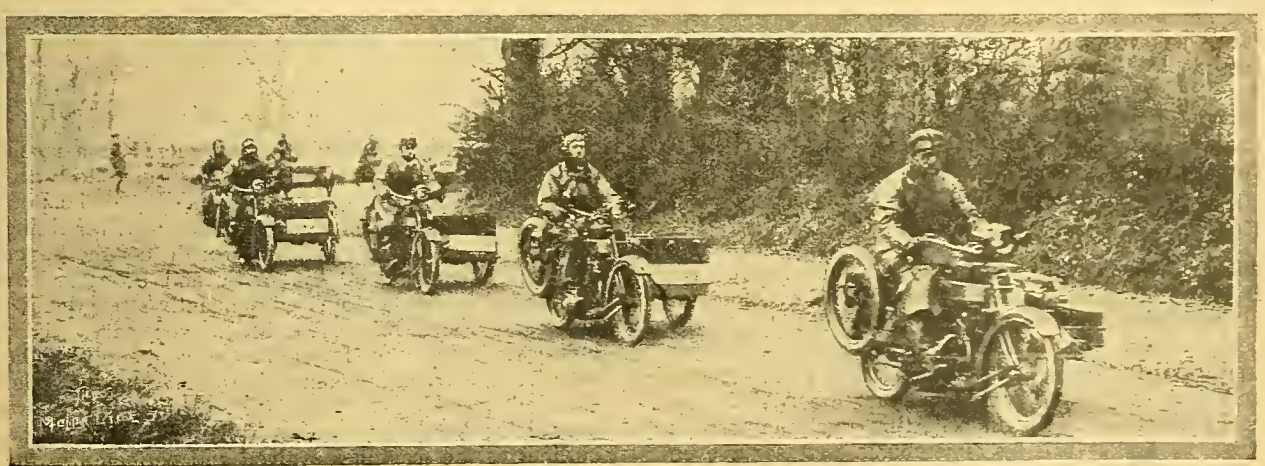
How the Machine Gun Sidecars are delivered to the Authorities.



A study in motor cycling attire for the winter months—a photograph taken of a batch of motor machine gun outfits and the men who drive them from works to training centre.

TO keep pace with the requirements of the Motor Machine Gun Service, the Clyno works of Wolverhampton (the capacity of which has been doubled during the last few months) are kept at full pressure day and night. Men in khaki, who have seen service in the trenches, have been fetched home again to handle the lathes. The success of the motor machine gun sidecar outfit is now common knowledge. Since Mr. Winston Churchill inspected at the Horse Guards Parade, Whitehall, at the end of last summer, the first unit of the kind produced by Mr. Alfred A. Scott, and adapted for warlike uses by Messrs. Vickers, Ltd., developments in design have been rapid, and the Vickers-Clyno machines which are now used are very different in construction from the original machine gun sidecars. We wish we could tell our readers all about them and their capabilities, but we must bow to the decision of the Censor who forbids.

At regular intervals a long procession of machines moves from the Wolverhampton works of the Clyno Engineering Company to the Government base near London, and the accompanying photographs were taken on the occasion of one of these journeys. To see them reminds one of a long distance trial. A very early start is made from Wolverhampton, so that the machines may be delivered at the Government depot in daylight, and the inhabitants of certain districts of Wolverhampton have now become quite accustomed to the roar of engines disturbing them from their slumbers at about 3.30 a.m. A move off is made at 4.15 a.m., Mr. Frank Smith usually leading the way on his 20-30 h.p. Sporting Peugeot, the sidecars forming a very orderly line, the rear being brought up by an A.S.C., M.T., Inspecting Officer, who is usually at the wheel of a Vauxhall car and observes all performances and cause of stoppages, should any occur. The toolbags incidentally are sealed prior to the start. The first stop on the trip under notice was at Shipston for breakfast, and the party then proceeded to Oxford, veering off to the right after leaving Maidenhead, and passing through old Eton, where the passage of the machine gun sidecars has now become an event to be



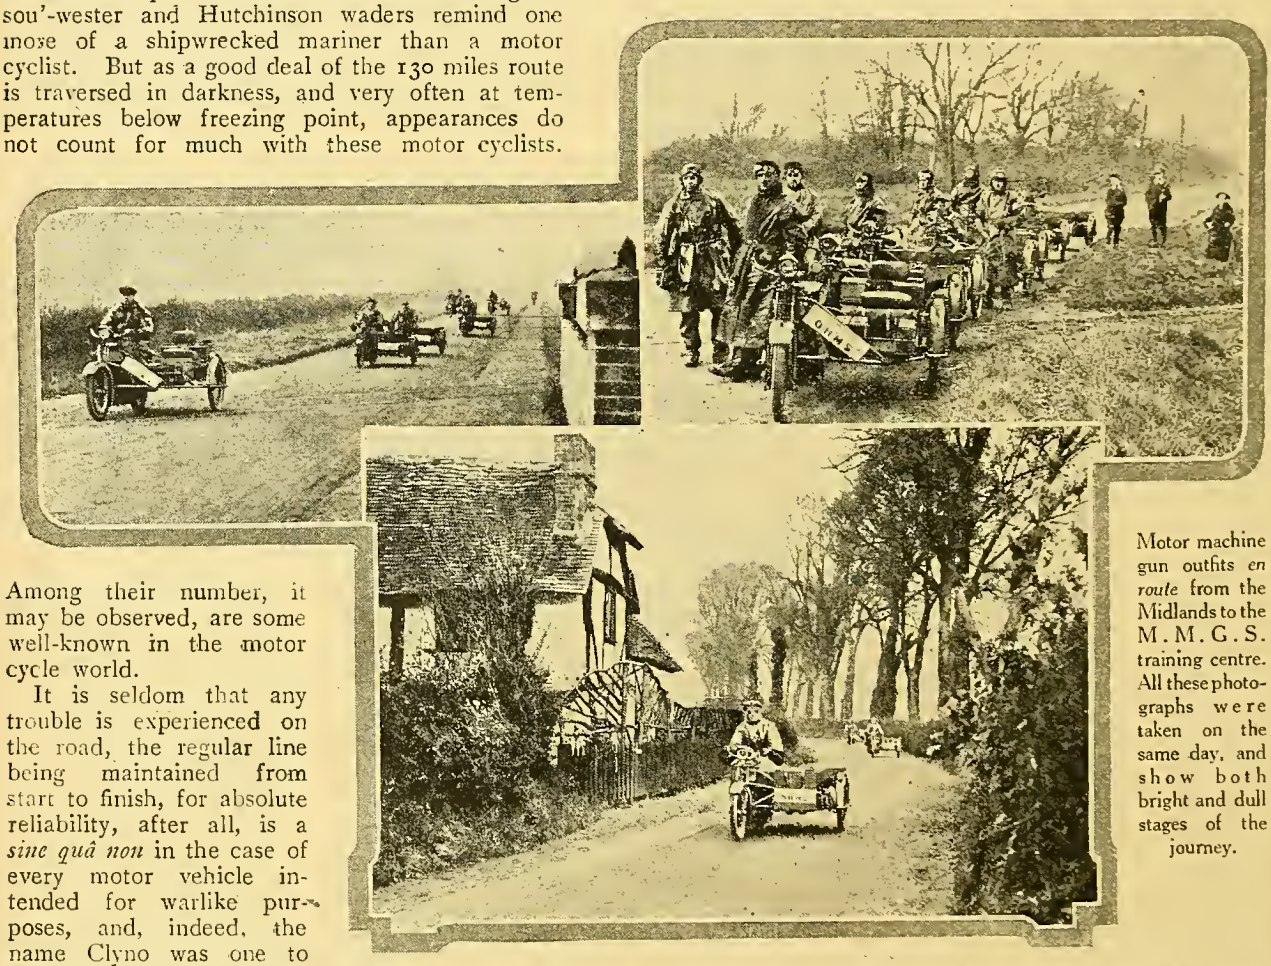
A string of Vickers-Clyno machine gun outfits on the way from the makers' works to the M.M.G.S. training centre.

From Works to Army.—

looked forward to by the boys of Eton College. In fact, all along the route the machines in their khaki finish are regarded with the greatest interest, and, as they flash along the road in orderly fashion, many an old farm hand, judging by his look of consternation, observes to a fellow son of the soil some such remark as was recently heard, "By gum! What are we coming to now? They be airyplanes."

A Study in Riding Apparel.

The garb which some of the drivers adopt is really funny. The men usually wear two or three coats with a full length oilskin on top, with a waist strap which causes the top and bottom of the coat to bulge. And sou'-wester and Hutchinson waders remind one more of a shipwrecked mariner than a motor cyclist. But as a good deal of the 130 miles route is traversed in darkness, and very often at temperatures below freezing point, appearances do not count for much with these motor cyclists.



Motor machine gun outfits *en route* from the Midlands to the M.M.G.S. training centre. All these photographs were taken on the same day, and show both bright and dull stages of the journey.

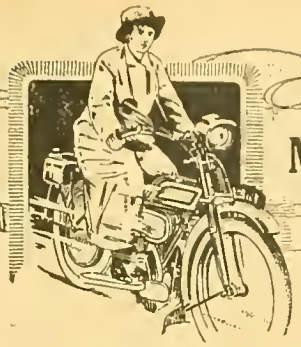
Among their number, it may be observed, are some well-known in the motor cycle world.

It is seldom that any trouble is experienced on the road, the regular line being maintained from start to finish, for absolute reliability, after all, is a *sine quâ non* in the case of every motor vehicle intended for warlike purposes, and, indeed, the name Clyno was one to conjure with for reliability before anybody in this country thought about a war.

The Beneficial Effect of the Six Days Trial.

In this connection one can only now fully appreciate the good effect which was caused by the A.C.U. Six Days Trials routes being arranged over the most difficult road surfaces in the country, usually off the beaten track. In the Lake District and Peak District trials of 1913 and 1914 there were many manufacturers and competitors who considered that the A.C.U. had acted most unwisely in selecting such impossible surfaces, and it will be remembered that some even of the more assertive called protest meetings and tried to organise a strike. But after all, as we pointed out at the time, motor cycles had reached such a stage of excellence that abnormal surfaces were imperative to weed out the weaklings. We, personally, covered both the trials in question on a motor bicycle, and admit that we suffered discomfort on occasion, but, though we were jolted about on bumpy stony tracks, we realised the good that was being done in eliminating weaknesses in design—particularly in sidecar chassis—by reason of the extreme severity of the test. Now, moreover, British manufacturers are reaping the benefit, for, instead of having to evolve a machine which shall be suitable for abnormal uses in Flanders and other countries where roads are not so perfect as in England, our machines are so staunchly constructed as a result of abnormal trials that they are well able to withstand the roughest usage to which they may be put. Of course, motor cycles were never intended for riding regularly over ploughed fields, rough commons, or over roads churned up by shells, and being grossly overloaded in the bargain; consequently strengthening here and there has been found necessary. For instance, instead of four-point attachment for the sidecar, five separate connections are now the rule. Generally speaking, however, the machines which have proved invaluable in this war follow the same broad outlines as the machines evolved and perfected in the piping days of peace.

Modern Girls and Modern Motor Cycling



SOME CRITICISMS ANSWERED.

FROM a motor cycling point of view British girls are divided into three classes—those who are lucky enough to possess motor cycles of their own; those who retain the motoring spirit while they lack the motor cycle, and who occasionally get a chance of a mount through a brother or a friend; and those who either disapprove of, or are not in the least interested in, motor cycling.

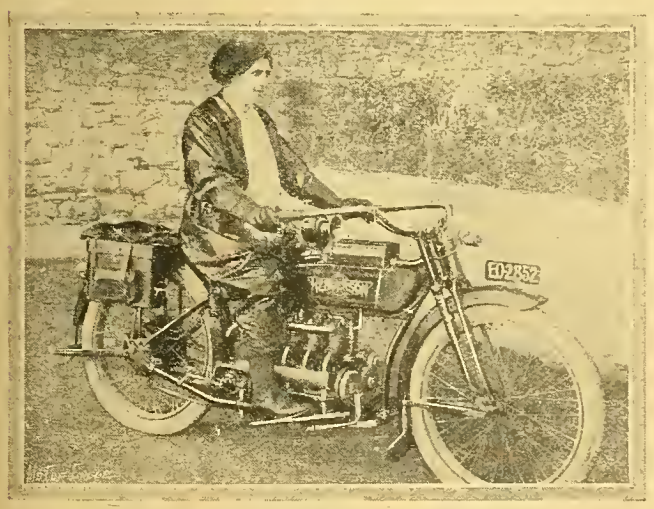
These last, unfortunately, are by no means least, and I should feel rewarded if this article reduces their majority. A keen motor cyclist myself, it seems to me an overwhelming pity that, in these days when motor cycles are on the road in their thousands, carrying riders of both sexes, many women should remain so sternly set against such a splendid sport. That it is a fine sport is undeniable. There is simply no limit to the joy of it, of flying up hill and down dale on a tireless thing which never stops and which passes everything on the road, which is absolutely at your command, and which will carry you miles and miles into the country every fine holiday. Nothing will bring so effectually to your cheeks the colour which the cinema and the theatre and the concert have driven out of them.

Is it Expensive?

Now for the objections. The foremost one, of course, is that of expense. Motor cycling is not so expensive as people believe, that is, of course, if we consider the lightest types of motor cycles with which it is usual for a lady to commence, at any rate, her motor cycling novitiate. Now that so many lightweight machines are being made, many of which are ideal alike in size, speed, and simplicity for the lady rider, and few of which exceed £35, it cannot be urged that the first cost is prohibitive. How much does the average father pay out on his daughter's behalf in theatre tickets, dances, riding lessons, and singing lessons every year? A man with whom I talked on this subject the other day said that his two daughters cost him a hundred a year good, in allowances and extras. "Perhaps," he said, ruefully, "if they had one of these motor cycles each they wouldn't want to be gadding in and out of entertainments the whole of the day long." I can assure him that they would not—nor would there be so many doctor's bills to pay on their behalf, perhaps.

A NOVEL GUN MASCOT.

A neat aluminium-bodied sidecar recently seen in Birmingham, which has a small model of a naval gun mounted on a special platform above the nose of the body. Presumably the gun was intended for a replica of the 4·7in. weapon, although some of the breech mechanism was dubious. Attached to a T.T. twin, and handled by an officer of the sporting type, the combination created quite a sensaiton.



A POWERFUL MOUNT FOR A LADY.

Mrs. Quinlan, of Barrow-in-Furness, on her four-cylinder Henderson. It is not often one sees ladies mounted on such powerful machines as the Henderson, but the flexibility of this machine renders it quite suitable for use by the fair sex.

More Grandmotherly Objections.

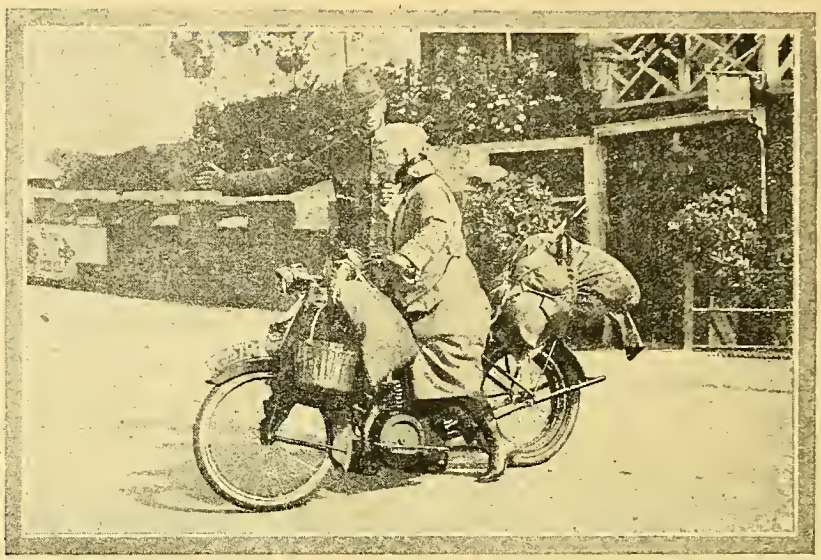
The second great objection—I hear it principally from the lips of mothers—is guised under the word "unsuitable." In these enlightened days of the sporting girl, "improper" and "unladylike" seem to me to be the last words to apply to this particular form of sport. It is no more unladylike to ride on a motor bicycle than on an ordinary "push bicycle," and it cannot even be said of the sport that it is unusual—hundreds of girls can be seen racing comfortably out into the country either behind their friends on the pillion seat or on machines of their own.

"Dangerous" is another word applied—and this I would dismiss with contempt as regards the actual driving of a motor bicycle, for the average woman has a head every bit as clear as that of her brother. With regard to pillion riding, however, there is some

thing in the comment. Accidents have happened to those riding on carriers, but more often than not they have been the result of careless or reckless driving.

Some Advantages.

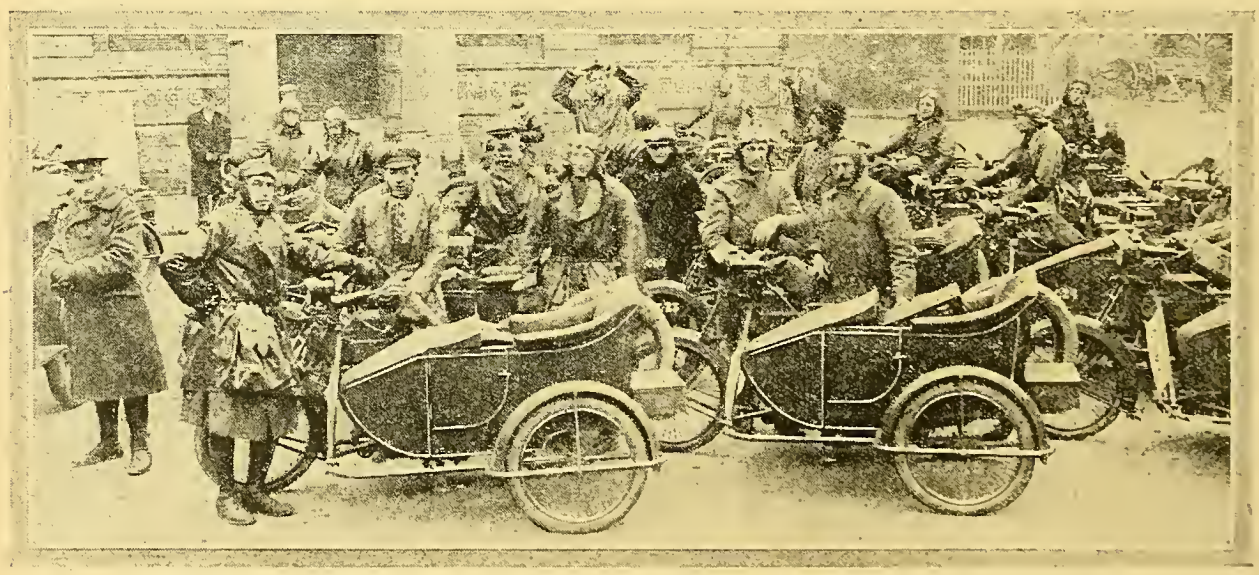
Now for the advantages. A very solid one lies in the fact that motor cycling can sometimes be made an asset in a business career. Not very long ago, a friend of mine who had entered the crowded ranks of women secretaries, and who was badly in need of a post, saw an advertisement for a secretary to a motor cycle agent. Hosts of girls answered the advertisement, but my friend gained the day in front of thirty-seven likely candidates simply because her employer discovered that she had an interest in and knowledge of motor cycles. Here is a good opening for girl secretaries who have their living to make, and another lies in the rapidly growing demand for lady demonstrators. Hence I would advise those who cannot at the moment afford a mount of their own to make themselves familiar with the makes and methods of operation of the modern motor cycle.



SOME LOAD! A lady motor cyclist with a full equipment of luggage. Such loading as that shown is not to be recommended for reasons of personal safety.

Before actually ordering a machine go as thoroughly as possible into the science—for it is one—of the winged roadster. Get to understand the engine and the parts thoroughly. Get to know the makes—you can easily see them all by a visit to a good agent or a walk down Great Portland Street—so well that you can recognise them when you see them on the road. Get a handbook and study the care of the machine and the possible obstacles which you will have to overcome.

O.M.S.

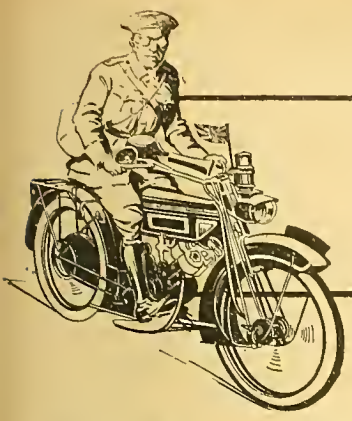


DELIVERING MOTOR MACHINE GUNS TO THE MILITARY AUTHORITIES. (See pages 577-578.)

The delivery convoy halts for lunch. Note the pleasure type sidecars in the foreground; these are mainly used for the conveyance of officers.

THE VILLAGE CLOCKMAKER TO THE RESCUE.

The other day we heard of a strange magneto trouble on one of the makes of machines accepted by the War Office. The contact breaker springs were far too brittle, and snapped frequently. This is fortunately an uncommon occurrence, but so prevalent did the trouble become that the particular officer in charge at the Signal Station called in the village clockmaker to the rescue, who, by skilfully making new springs of a less brittle nature out of clock springs, saved the situation.



THE CAUSES OF ENGINE STOPS.

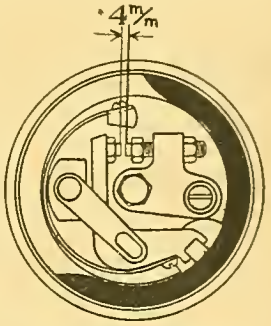
How an Intelligent Diagnosis may save Needless Trouble.

IT is almost impossible for a novice to acquire the knowledge necessary to enable him to effect *any* sort of repair to a motor cycle merely by means of a handbook. Practical experience on the road is absolutely necessary, but there are certain troubles which are likely to occur more frequently than others, which can well be anticipated and the cure known beforehand, and it is with these particular troubles that this short article is intended to deal. However, before proceeding to outline them it is desirable that the rider should know that by treating his machine with sympathy and considering carefully the symptoms, he will be able to determine what is really the matter with it merely by the pull and behaviour of the engine. Again, before a rider attempts to dismantle any portion of the machine, he should consider carefully for a moment or two the symptoms and the possible cause, as it is most unwise to disturb any part of a machine which is working properly on account of disturbing the joints. By tackling repairs hastily and thoughtlessly, it is quite easy to take down parts which are in thorough working order.

The Ignition System.

On the road, the most likely cause of trouble with a modern motor cycle is the plug, but with modern plugs if the proper amount of lubrication is given to the engine, trouble should not occur after a short mileage. We will suppose the rider is careering along the road at a comfortable speed with the engine firing regularly, when suddenly the engine stops firing, and the compression shows itself to be present when the machine is pulled up. Now a moment's thought will prove that this is due to the ignition. It can hardly be due to the tank having run dry of petrol, as an engine which runs out of petrol invariably gives signs a few minutes before it gives up the ghost, by misfiring, spluttering, and then continuing for a short distance. Again, foreign matter which might clog up the jet does not come through in such quantities as entirely to stop the petrol flowing. Thus we arrive at the simple diagnosis that the trouble is due to ignition, and the most likely cause of ignition trouble is in the plug. We therefore remove the plug, clean the points if they should be found to be charred or to have become oiled, and see that the clearance is .5 mm., measured by the "feeler" on the magneto spanner. If the porcelain of the plug and also the electrodes are tight, and the points clean and the right distance apart, the engine should fire again, failing which the contact breaker of the magneto should be examined. In damp weather the rocker arm sticks owing to the fibre bush on which it works swelling. If the engine be turned round, it will be seen whether the steel cam causes the platinum points to make and break properly. If the rocker arm remains stationary it will be necessary to remove it, and ease the fibre bush by rolling a piece of sandpaper as a pencil and easing the bush out very slightly. Even warming it will have the desired effect, but the cure would only be temporary.

The gap between the sparking plug points should be ·5 mm.



Contact breaker, showing correct gap of platinum points.

The platinum points should separate .4 mm. When checking the break of the points, notice particularly that the surfaces of the two tiny points of platinum are perfectly flat and clean. After a time they become charred or burnt, and it is then desirable to use a fine jeweller's file in order to clean and flatten them. This operation should be done very lightly, as platinum is expensive, and it is easily possible to file away a shilling's worth in a moment. After cleaning and facing up the points, the amount of break should be checked, and if an adjustment is necessary it is easily done by loosening the locknut at the end of the screw, and adjusting by the aid of the small spanner provided with every magneto. If this is not the trouble, and the timing has not slipped (this will have been proved by noticing if the contact breaker functions properly when the engine is being turned round), it may be due to the carbon brush in the high-tension terminal on the magneto. This brush bears on the brass slip-ring mounted on the armature, and is pressed into contact thereto by the aid of a tiny spiral spring, and so collects the current. Sometimes this pencil gets charred up, and more

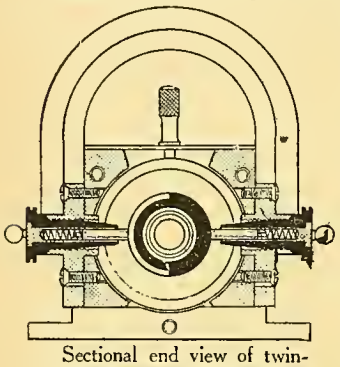
The high-tension terminal removed, showing carbon pencil, the action of which is governed by the tiny spiral spring shown.

The Causes of Engine Stops.—

frequently sticks in the guide on account of the presence of oil. Occasionally, therefore, the terminal should be removed and the pencil cleaned, and faced by rubbing it lightly on a piece of fine sandpaper or a file; also before replacing it ascertain that the pencil moves freely in its guide against the action of the spring.

Carburetter Troubles.

Reverting to our imaginary trip along the road aforesaid, had the engine shown signs of misfiring and spluttering *and a refusal to take any extra air*, one could be almost certain that it was due to a stoppage of the petrol supply, either by foreign matter in the petrol pipe itself or in one of the passages or jets of the carburetter. Almost invariably the extra air lever will determine this before a machine even comes to a standstill, and the jet of the carburetter should be taken out and cleared, likewise the petrol feed pipe. If the misfiring is due to a plug which has been oiled up, this trouble can usually be anticipated, as it is due to over-oiling, and over-oiling is signified by blue smoke emerging from the silencer. An engine should never be allowed to smoke, as it only leads to an excessively oily engine, rapid carbon deposits, and trouble with the plug points.

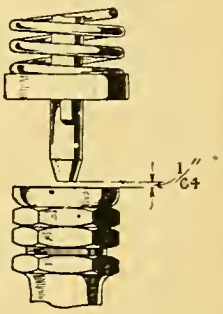


Sectional end view of twin-cylinder magneto showing carbon brushes which bear on brass ring.

Compression.

If, after the engine had stopped firing, the machine ran along more freely than usual when the valve lifter was released, it would show that compression was non-existent, and this might be due to a broken valve. Supposing, however, that the engine had been gradually falling off in power, and the explosions had become fluffy before it finally stopped, the trouble may be found to be due to a broken valve spring, or to the elongation of the valve stem, due to overheating, so closing the gap between the tappet and valve stem and preventing the valve head from touching its seating. (The exhaust valve most probably, as this is the hotter.)

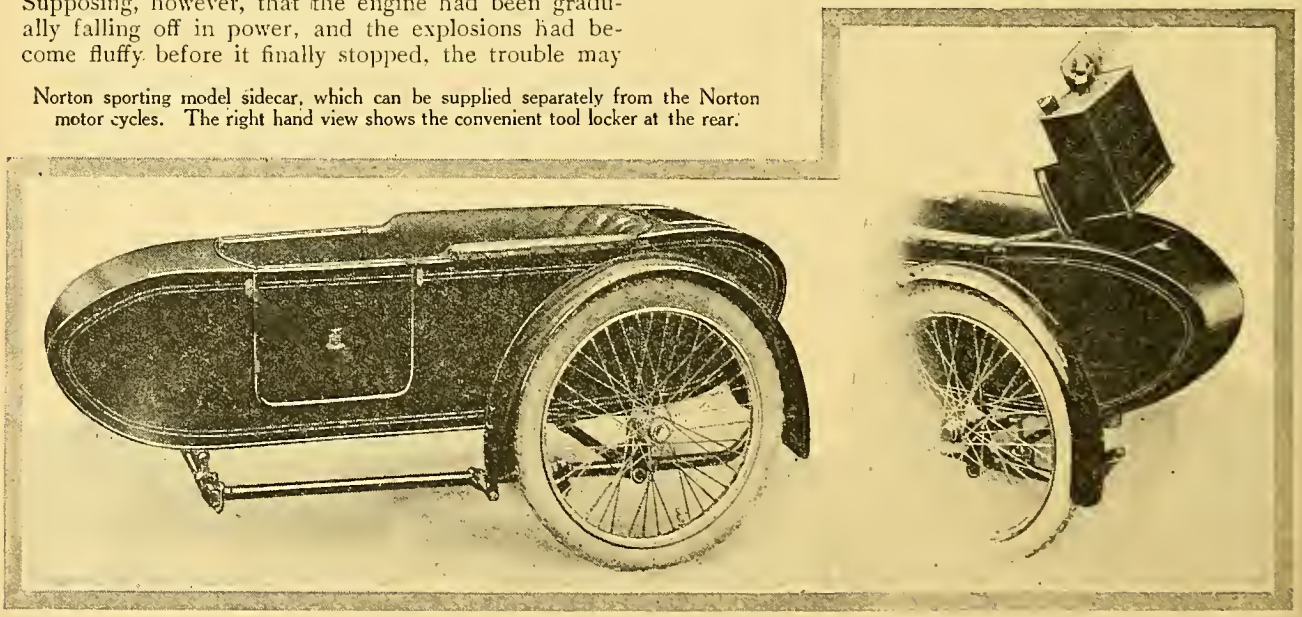
The correct tappet clearance is 1-64th of an inch, which is equal to .4 mm., and can be tested with the magneto gauge before mentioned, but some engines need slightly more clearance, 1.32in. not being excessive in some cases. On modern engines the clearance can readily be adjusted by means of the locknut on the tappet rod, which is a far better method than the laborious one of filing the end of the valve stem.



Correct clearance between valve tappet and valve stem.

Cleanliness Essential for Efficiency.

In outlining the above possible causes of engine stops on the road, we have intentionally omitted the possibility of the insulation of the high-tension wire being damaged, due to a sharp bend, or to the fact that it may have been cut by the metal security clips. At regular intervals the terminals, as well as the insulation of the wire, should be examined to make sure that leakage of current is impossible. Wet and mud, too, will readily cause short-circuiting, and the rider who desires to guard against ignition trouble should protect as far as possible the magneto terminals and wiring from the elements, and wrap each terminal with insulation tape. A tip to prevent water dripping down the high tension wire and so to the magneto, where it will cause endless trouble, is to cut a tiny hole in the middle of a rubber patch and thread the high tension wire through it. In this way the patch will act as an umbrella and drain off the water.



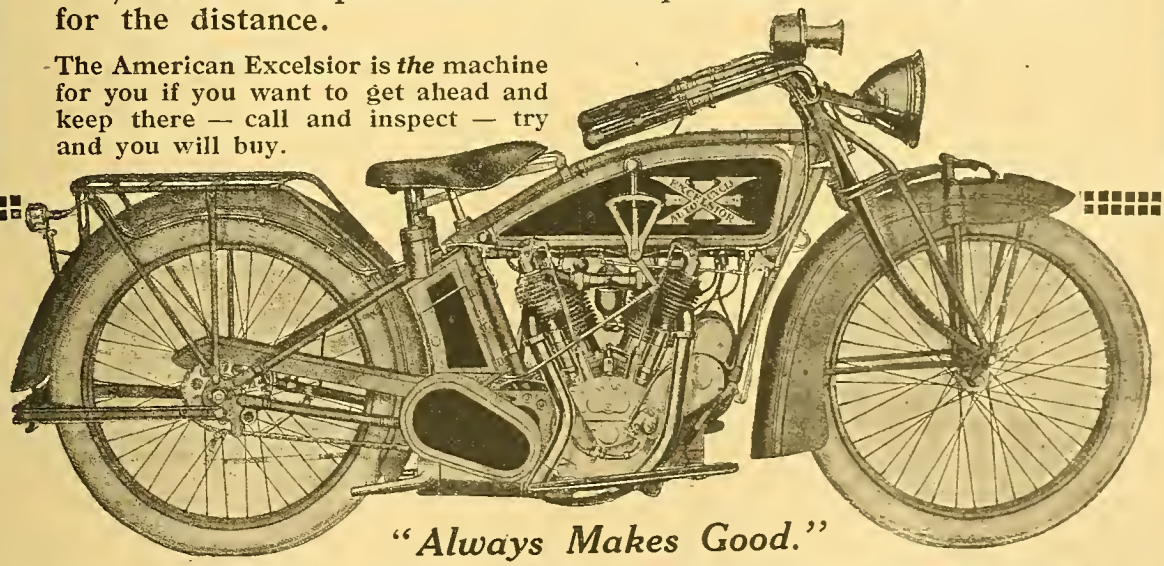
Norton sporting model sidecar, which can be supplied separately from the Norton motor cycles. The right hand view shows the convenient tool locker at the rear.

The
HOLDER
of the
WORLD'S 300 Miles Record

The AMERICAN EXCELSIOR
America's Best Auto-Cycle

— the first Motor Bike to attain a speed of 100 miles an hour — has smashed another world's record. In a 300 mile race in Chicago on September 12th, "The Good Old X" finished first in 3 hrs. 29 mins. 57.2/5 secs. — a speed of 87.51 miles per hour — World's Record for the distance.

The American Excelsior is *the* machine for you if you want to get ahead and keep there — call and inspect — try and you will buy.



"Always Makes Good."

Prices: STANDARD MODEL. 7 h.p., 3-speed countershaft gear, multiple disc clutch, chain drive, kick starter, mechanical lubrication **£80**

MODELE DE LUXE, as illustrated, complete with Dixie combination lighting and ignition, powerful head and tail lamps, electric horn, and speedometer **£90**

EXCELSIOR MOTOR MFG. & SUPPLY CO. EXCELSIOR AUTO CYCLE ALWAYS MAKES GOOD

Immediate Delivery of Both Models.

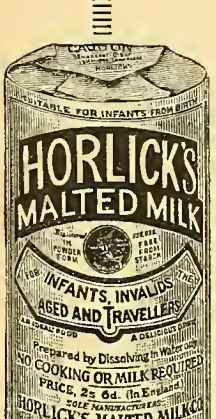
AGENTS! Applicants for this valuable agency for districts where we are not represented should write at once. The proposition is attractive:— A splendid machine, a moderate price, and early delivery.

In answering this advertisement it is desirable to mention "The Motor Cycle." A23

The Food Drink which promotes fitness and efficiency is



HORLICK'S MALTED MILK

A glass of Horlick's is always the best invigorator. Taken before a ride it will give strength and endurance, and after strenuous exertion there is no better pick-me-up. At all times it gives and maintains fitness and stamina, and is especially useful to men on Active Service.

SUPERIOR TO TEA, COFFEE, COCOA, AND BEEF EXTRACTS.

READY IN A MOMENT WITH HOT OR COLD WATER ONLY. NO COOKING.

Served in Hotels, Cafes, and Railway Refreshment Rooms.

Also available as delicious food tablets to be dissolved in the mouth. Relieve hunger and thirst and prevent fatigue.

Supplied in Sterilised Glass Bottles, at 1/6, 2/6, 11/-, by all Chemists and Stores.

The Tablets also in convenient Pocket Flasks at **6d.** and **1/-** each.

Liberal sample sent post free for 3d. in stamps.

HORLICK'S MALTED MILK COMPANY, SLOUGH BUCKS.

The Stewart Handy Worker

COMPRISES:

A Powerful Vice, with jaw opening of 4¼ inches. The jaws are 4 inches in width, and will hold any wood or metal article firmly and securely.

Pipe Vice, which will grip pipes up to 1½ inches in diameter.

Anvil, strongly and substantially made.

Drill Press, which can be operated at two speeds. Two drills supplied, and a rest to hold job to the drill.

A Steel Cutting Hardy, for cutting wire or steel.

Carborundum Grinding Wheel, diameter 4¾ inches, for sharpening wood or metal cutting tools. Three speeds—direct, 4 to 1, and 16 to 1. *Buffing Wheel, small Circular Saw, etc., could be fitted where Grinding Wheel attaches.*

Price Complete, 50/-

The "Bazaar and Mart" says:

"One of the cheapest and most ingenious combination tools for both amateur and professional mechanics that we have had brought to our notice is the Stewart Handy Worker, which embraces a number of different devices in most compact form, and whether in workshop, store, or garage, cannot fail to improve, while it will very greatly simplify, a great variety of jobs."

Of Ironmongers, Stores, or direct from

The COOPER-STEWART ENGINEERING Co., Ltd., 11, BROAD ST., BLOOMSBURY, LONDON, W.C.

SIX TOOLS IN ONE.

THE STEWART Handy Worker is a solidly-built tool, 2 feet long, 1 foot high, and weighing 76 lb. It comprises six essential devices, each absolutely efficient, and as good for its purpose as the most expensive of its kind. Together they form a tool outfit which motor cyclists and others can use with great advantage. Apart from its efficiency, its compactness will appeal most to anyone who is short of room space. The Stewart Handy Worker takes up so little space that it can be used in the smallest workshop. Its cheapness, too, cannot fail to impress those who, while requiring the best tools, wish to obtain them at the lowest price possible.

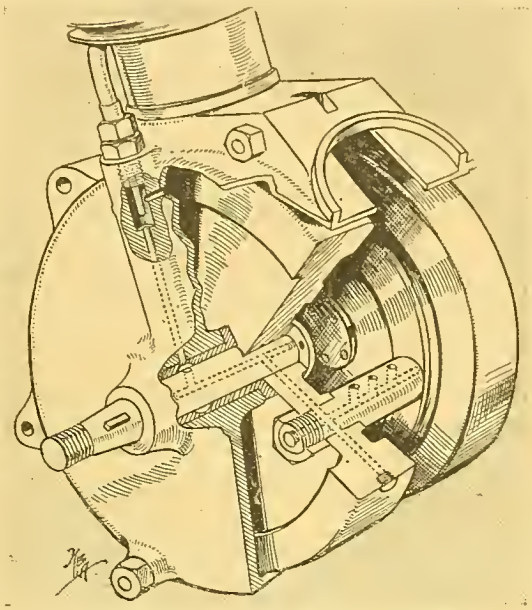
THE A.J.S. LUBRICATION SYSTEM.

Direct Oil Supply to the Main Bearings.

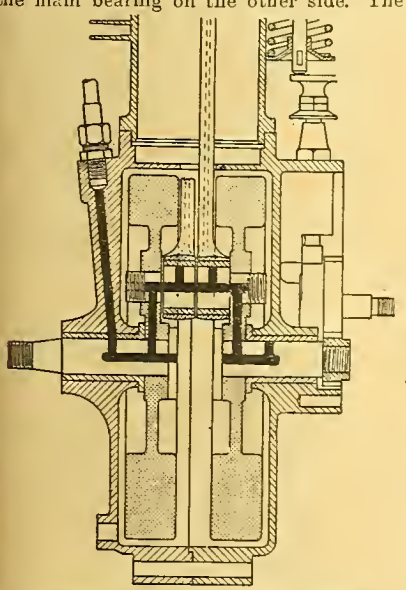
MESSRS. A. J. STEVENS AND CO., LTD., do not rely entirely upon the splash system for the adequate lubrication of all the moving parts of their engine. The oil is delivered to the crank case through a semi-automatic lubricator. On the plunger being depressed the spring forces the oil into the crank case union, but, as in previous models, it does not pass through a sight feed, as Messrs. A. J. Stevens and Co. consider this to be unnecessary, as an oil orifice of a certain diameter is supplied, and they consider that this orifice allows sufficient oil to be delivered to the engine, irrespective of the thickness of the lubricant. After leaving the union, which is screwed into a part of the crank case casting, the oil enters a small chamber; part of it leaks through into the crank case, but the majority passes down the special oilway to the main bearing on the pulley side. The bush is drilled and the hole communicates with a deep groove surrounding the journal, which is always full of oil. A hole in the journal is connected to a passage through the flywheel, which in turn leads to another passage inside the crank pin, whence the oil exudes through three holes, and gives the big end—one of the most important bearings in the engine—plenty of oil.

To revert again to the journal of the main bearing, it will be clearly seen that the two holes register every complete revolution. On leaving the crank pin the oil descends through the flywheel to the main bearing on the other side. The owner is recommended to depress the plunger every five miles, and all the time the oil pump is emptying itself the lubricant is flowing into the crank case.

This is certainly a very sound scheme, and a great improvement upon the simple splash system. Of course, the oil naturally leaks through into the crank case in sufficient quantities to lubricate the cylinders and timing gear by splash. By this means all trouble and worry of adjusting the drip feed are overcome.



A.J.S. lubrication, showing drilled oilways leading to main bearings.



Sectional drawing of the A.J.S. crank case. The oilways to main shaft and crank pin are shown black.

LATEST BROWN & BARLOW CARBURETTERS.

Improved Flooding Device.

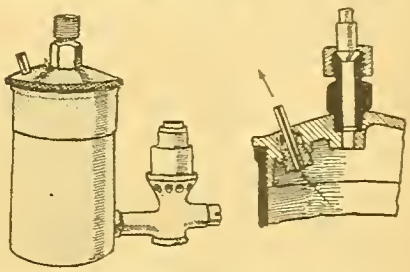
ALTHOUGH the B. and B. carburetter itself is in principle unchanged, yet there is a minor improvement which will be of interest to motor cyclists. This consists of a new float chamber and flooding button having several peculiarities. The B. and B. carburetters so far produced have had the bearing and spring for the flooding button outside the float chamber cover, a thin stem projecting through the bearing to come in contact with the float. The latest button has its bearing and spring wholly within the float chamber itself, and the end of the button only projects through the lid, making the appearance of the carburetter very much neater. Through the centre of the flooding button a hole is drilled, forming the sole air vent for the float chamber, and it is here that the question of careful design comes in. It will be remembered that with the carburetters of some years ago, if the flooding button were held down for any length of time, petrol would flow through the vent in the float chamber as well as out of the main jet. The result would be a considerable amount of waste petrol as well as a certain risk of fire if the engine should fire back into the carburetter when starting. The hole through the flooding button gets over this difficulty very easily and simply, because when the thumb is placed on the button the air within the float chamber cannot escape. Consequently, when the button is pressed down petrol can only arise in the float chamber until the air above the petrol is at a certain pressure, and it cannot rise to such an extent as to leak from the float chamber itself. On the other hand, as the petrol which is in the float chamber is at pressure due to the compressed air in the float chamber, it flows in a steady stream through the jet, and an excess of petrol is obtained where it is required for starting purposes.

To demonstrate the foregoing, a carburetter was shown to us fixed on an ingenious test stand used by Messrs. Brown and Barlow. The choke tube and throttle casing having been taken away the jet chamber was exposed, and by sharply depressing the flooding button a stream of petrol was jerked out of the jet if the thumb covered the air vent. If, on the other hand, the flooding button was depressed by the finger nail only, thus uncovering the air vent, petrol filled the float chamber, and first bubbled out of the jet, finally proceeding from both jet and air vent in a steady stream.

The Petrol Feed.

The B. and B. carburetters are of that type wherein petrol is fed to the top of the float chamber instead of to the underneath part. This has been done for some little time, but it is interesting to recall the reasons for the change. In the first place the little weighted levers acting on the needle valve through a collar and resting on the float could not be made to stay steady, but rattled about, jerking the needle off and on its seating during the time the machine was on the road. Thus considerable wear took place on the needle valve face, while the cut-off of the petrol was anything but steady. With the present instrument the needle has a small collar, and its stem is placed through a hole in the float, the collar resting on the top of the float, while the needle end of the valve is, of course, uppermost, and rests in a seating immediately below the petrol pipe. Thus, there is no lever mechanism, and the cut-off is much smoother, as can be demonstrated by experiment.

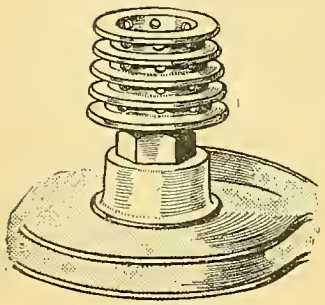
The jet supply pipe now is placed nearer to the bottom of the float chamber, yet not sufficiently near to allow accumulated dirt to flow into the jet. Last year's models had the supply pipe somewhat higher up on the side of the float chamber, with the result that if a machine were swung over to any great extent at a corner the supply of petrol was interfered with.



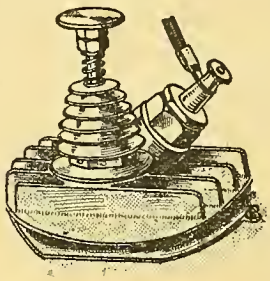
Top feed float chamber of latest pattern Brown and Barlow single-jet carburetter, showing hollow flooding button.

Cooling Devices for Valve Caps.

Greater Efficiency obtained by Reduction of Solid Masses of Metals.

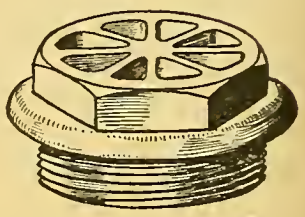


Air-cooled valve cap fitted to a B.S.A. ridden by Kenneth Holden in a T.T. race.



F.N. compression tap, as used on T.T. machines of that make.

Radiating device on valve cap of T.T. Ariel.



Blackburne valve cap, designed to provide an increased cooling surface.

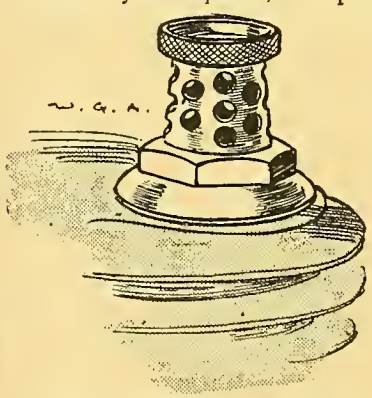
FOR a very considerable time designers of petrol motors, especially those of the air-cooled variety as used on motor cycles, have been endeavouring by various means to reduce to the greatest possible degree the temperature generated and retained in the cylinders, valves, and pistons of the engines. Up till quite recently their efforts have been chiefly centred on improving the design of valves, valve pockets, ports, cams, and so on, all aiming at the reduction of the heat, thereby increasing the volumetric efficiency, but after a certain point is reached the heat can no longer be reduced by these means, and artificial ones have to be adopted. There is little doubt that one of the chief causes of damaged plugs and burned and broken valves, especially on air-cooled engines, is not so much the actual heat generated, which, of course, is very considerable, but the heat which is retained and accumulated in the various masses of metal such as valve caps, heavy spark plugs, and the thickened portions of the castings necessary to allow these parts to be screwed in. The chief offender is probably the valve cap, which up till recently has frequently taken the form of a heavy almost solid piece of metal capable of retaining any amount of undesirable heat, the bulk of which is immediately transmitted to, and retained in the region of, the valves and plugs.

In connection with aero engines, where every ounce of efficiency is required, this point has received considerably more attention with very satisfactory results. Even in the case of water-cooled cars it has been found an advantage to do away with masses of metal used when valve caps are fitted, and now quite a number are fitted instead with detachable cylinder heads and plugs screwed direct into the cylinder, and so receiving the benefit of water-cooling, and in spite of the reduction in accessibility they have proved very beneficial in reducing valve and plug troubles, in addition to reducing expense of manufacture which was the main object.

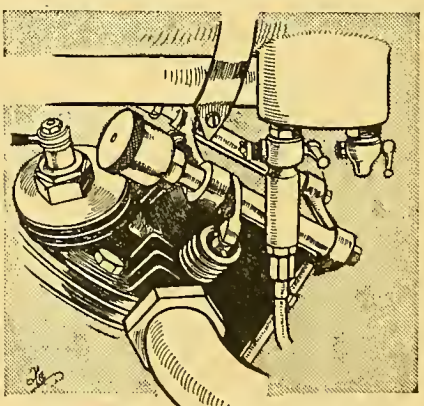
During the last few years quite a number of cooling devices have been tried on motor cycles, especially in races, though hardly any have so far been adopted as standard fittings. They have taken various forms, consisting in some cases of fitting auxiliary fins to give more cooling surface for the valve pockets and cylinder heads, devices for simply cooling the valve caps, and even compression taps and spark plugs, the chief idea being to enable the heat usually retained by these fittings to radiate away as rapidly as possible.

Devices that have been tried.

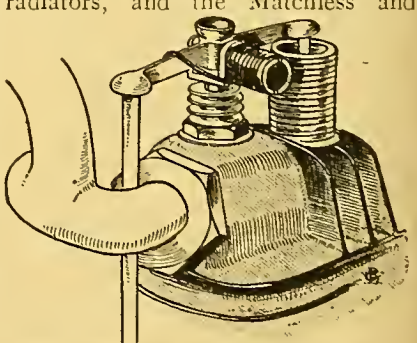
In the 1913 T.T. races we find the Ariel machines with a radiating device fitted to the exhaust valve caps. It consisted of five thin metal discs mounted on a bolt screwed into the cap; these discs were shaped so that the centre was raised slightly and acted as a means of separating the discs, which thus offered considerable radiating surface. In the same race B.S.A.'s were fitted with valve cap radiators, and the Matchless and



Fitting on T.T. B.S.A. valve caps to facilitate quick removal, at the same time providing extra cooling surface.

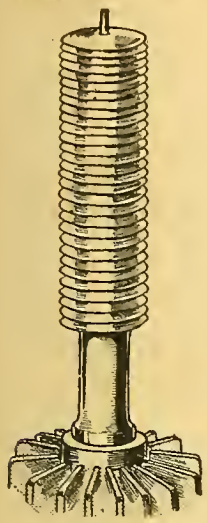


Radiating fins attached to sparking plug, as used by Matchless and Motosacoche in 1913 Tourist Trophy races.



F.N. inlet valve rocker support showing cooling fins.

Cooling Devices for Valve Caps.—

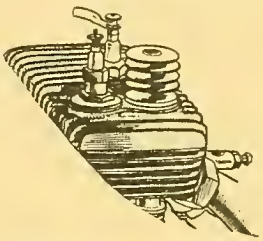


Additional radiating surface provided on the Cyclonette.

M.A.G. - engined Motosacoche with a device for attaching radiating fins to the plugs. The former consisted of a tube let into the valve cap and drilled with numerous holes, while the latter consisted of several cast-iron radiating fins which were drilled to the size of the body of a long-bodied plug and split and fitted with a clamping screw; this device must have kept a considerable amount of heat away from the plug porcelain. In the 1912 T.T. the Scott racers had special thin steel plug adapters which were let into the cylinder through the water jackets, so that the plug was practically water-cooled. Turning to the 1914 T.T. races we find the F.N. machines fitted with radiating fins on the compression taps and even on the studs supporting the inlet rocker arms. The Matchless was again fitted with the plug radiators, while the Motosacoche was fitted with the De Lissa patent air-cooled exhaust valve, which entirely does away with the valve cap and actually exposes the valve to the air; in addition to this the powerful spring fitted to the top of the valve acts as a radiator to the valve itself. This arrangement also scores tremendously over all the others used, inasmuch as that where the others add metal to gain the extra cooling surface this one does away with it.

So far as ordinary touring mounts go, one seldom finds any of the arrangements fitted as standard. Some years ago a device was invented and placed on the market, the object being to water-cool the exhaust valve cap. It consisted of a water jacketed valve cap and a small tank and radiator placed at the side of the petrol tank.

In the German Cyclonette and Phanomobiles, long copper tubes with radiating gills were attached to the valve caps. The Motosacoche has the De Lissa valve as standard, and for the last two years the Blackburne has had a valve cap with fins. This year's J.A.P. engines also have a valve cap of this description. Quite a number of spark plugs, especially those intended for aero work, have bodies grooved to increase the surface exposed to the air for cooling purposes.



Puch air-cooled exhaust valve cap.

RE-MAGNETISING MAGNETS.

Instructive Demonstrations.

A GOOD many readers are of the opinion that there is some great mystery about the re-magnetising of the magneto magnets. The process, however, is an exceedingly simple one, which anybody can do provided he has the necessary apparatus, but the worst of it is that the apparatus necessary is very rarely found elsewhere than in a magneto factory or a generating station. The process consists simply of wiping the poles of the magnets across the poles of an electro-magnet about twelve to fifteen times in succession, and the job is done.

We recently saw the operation carried out in the electrical laboratory of Messrs. the Harley-Davidson Motor Co., Ltd., and also in the magneto department of Messrs. C. A. Vandervell and Co., Ltd. Messrs. C. A. Vandervell have a large electro-magnet through which a 230 volt town circuit current is passed.

The operation consists in taking the magnets and holding it loosely above, but not too close to, the electro-magnet after the current has been switched on. If the correct pole pieces are opposite the magnets will remain perfectly steady, but if, on the other hand, like poles are opposite—that is to say, the north pole of the magneto is opposite the north pole of the electro-magnet—a violent repelling action is felt, and the magneto is either twisted or pushed in the hand.

This reminds one of the old rule in the books on elementary electricity and magnetism, that "like poles repel, unlike poles attract." Therefore, if the repelling action is felt the magneto is turned round, when the two poles are rapidly pulled down to the electro-magnet. The pulling force exerted is usually so great that it is impossible to pull the magneto straight away vertically, but the magneto-magnet can nearly always be slid off the poles of the electro-magnet by pulling it hard towards one. If this is done, say, a dozen times in succession, it is more than likely that the magnet has been adequately magnetised. Messrs. Vandervell, however, have improved upon this process by fitting up a circuit-breaking arrangement on the wall adjacent to the bench on which the electro-magnet is fitted, and the operation in this case is merely to leave the magneto in position and to turn the handle on the circuit-breaker switch about a dozen or fifteen times in succession.

The magneto is now adequately magnetised, or, in other words, saturated with magnetism, and the degree of magnetism is tested by means of an instrument known as a fluximeter, which measures the degree of magnetic force. The instrument shows a graduated scale, divided into degrees of magnetism, and by the aid of this it is seen if the magneto is up to the requisite standard of magnetism. Once magnetised, a "keeper" or flat bar of iron is placed over the poles of the magnet and left there until it is mounted on the magneto.

Road Signals for Cattle Driving after Dark.

The A.A. and M.U. has made representations to the Home Office on the subject of the danger caused by the driving of cattle and other animals on the road after dark without lights, or any adequate means of indicating to approaching vehicles their presence on the road. The Association has suggested that the persons in charge be compelled to carry lamps of a suitable type both at the front and rear of the animals, and that there should also be an obligation upon these persons to signal to approaching vehicles.

The cattle danger is an old trouble, and so long ago as the early part of 1909 the Coventry Motor Club presented a petition bearing hundreds of signatures to the Warwickshire County Council on the same subject, but without avail.

R.E. Despatch Riders.

The position of motor cyclists who are on the different waiting lists of the Royal Engineers despatch riders is still somewhat obscure. We have, on behalf of our readers, endeavoured to obtain details of their position under Lord Derby's scheme, and it is clear that men should enlist under the group system, notifying the Recruiting Officer that they have been passed for the R.E. when a vacancy occurs. We learn that men who now apply for positions as motor cyclist despatch riders will be enlisted, classified, and passed to the reserve, as in the usual case, and a note made of their wishes to join the Royal Engineers Signal Service as despatch riders. Should vacancies occur before the group in which they are placed is called up for service, they can present themselves for immediate enlistment with the Colours.

The arrangement which has already been made for the Lancashire district, at any rate, is for the application forms of motor cyclists, signed by the inspecting officer, to be first approved by the Officer Commanding the Training Centre, then forwarded to the Recruiting Officer nearest the candidates' homes, with instructions to the R.O. to enlist the men, classify and pass them to the reserve, making a note of their wishes to join the R.E. as motor cyclists. The R.E. application form for enlistment will be attached to the men's attestation papers, and as the men are required to be called up the respective Recruiting Officers will be notified.

Motor cyclists in the West Lancashire divisional area should apply to Mr. S. W. Phillpott, 60, Lime Street, Liverpool.

AUSTRALIAN MILITARY MOTOR CYCLISTS.

Motor Cyclists and Recruiting.

Applications still continue to reach us from prospective recruits for the Motor Machine Gun Service, but for two weeks it has definitely been stated that recruiting is closed for this branch of the Service.

Average Prices.

We give below the average prices of second-hand models offered for sale in *The Motor Cycle*. Where it is possible to obtain a sufficient number of each model, the average for the past week is quoted. If there were not at least two advertisements, then the last occasion on which they were quoted is given.

Make.	Year.	H.P.	Average for last week.	Latest weekly average obtainable
A.J.S.	1915	6 3-sp. sidecar	—	£90
,,	1914	6 3-sp. sidecar	£74	—
,,	1913	6 3-sp. sidecar	£55	—
,,	1915	2¾ 3-speed	—	£48

,,	1913	3½ 3-speed	£38	—
Williamson	1914	8 2-sp. sidecar	—	£65
Zenith	1914	8 Gradua sidecar	£67	—
,,	1914	6 Gradua sidecar	—	£54

Park Speed Limits.

We understand that the twelve miles per hour speed limits in the London parks are being very strictly enforced just now.

Commission for Well-known Scottish Motorist.

Mr. George H. Cutbush, A.M.I.A.E., well known in connection with Glasgow motor circles, and who has been acting as inspector of Royal Engineer despatch riders for the Lowland Division, has been given a commission in the Lowland Divisional Signal Company R.E. (T.)

A Fine Record.

The December number of the Rudge Record, the house journal of Rudge-Whitworth, Ltd., consists of a second special war issue. As such it contains pictures and letters from many R.W. men who are on active service, and when one remembers that the works are working day and night on munitions, one realises that the Rudge firm are doing their share in the conflict.

The National War Funds.

At the week-end the principal war funds stood as follow:

The Prince of Wales's National Relief Fund (£2,793,000 distributed)	£5,631,980	0	0
The Queen's Work for Women Fund	167,261	17	0
The *Weekly Dispatch* Tobacco Fund	90,934	0	0
The Times Fund for the Sick and Wounded	2,400,723	15	9
Daily Chronicle Xmas Gift Fund	18,595	3	0
Daily News Xmas Pudding Fund	22,638	0	0

Aeroplane v. Motor Cycle.

Any speed "stunt" out of the ordinary gratifies our American friends, and, consequently, it was not altogether surprising to hear that at the Wisconsin State Fair there was a race between a motor cyclist and an aeroplane round a dirt track. The aviator was so outclassed that the rider of the motor cycle—a Harley-Davidson—had to slow down to keep the race interesting for the spectators.

Three Roads.—Edinburgh-Glasgow.

There are three main roads between Scotland's two principal cities, and having tried all three on many occasions lately on both passenger and solo mounts (unsprung frames, of course), the writer's experiences may be useful to motorists who may have occasion to do this journey.

The first road tried was *via* Bathgate and Airdrie. Though short (about forty-four miles) the surface is abominable, and would afford excellent preparatory training for an intending despatch rider in Gallipoli. Avoid it at all costs. The second route is *via* Falkirk, and enters Glasgow by Cumbernauld. The surface is excellent, except about Linlithgow and Falkirk; the narrow streets of the latter town necessitate careful driving. This route is fairly long. The third route is by far the best. The surface is uniformly good, the gradients insignificant, and the distance comparatively short (about forty-four miles). The road runs through Midcalder, Holytown, and Bellshill. This is indeed a "no trouble" route.

5,995 Motor Cyclist Recruits.

Now that recruiting for the M.M.C.S. and R.E. (signal section) has closed, it is interesting to note that no fewer than 5,995 prospective recruits have been dealt with by Mr. Geoffrey Smith, Editor of *The Motor Cycle*, who is honorary inspecting officer for these sections. The figures give some idea of the magnificent response of motor cyclists to the call of the country.

Our Spring Frame Campaign.

For once in a way we have this week an issue of *The Motor Cycle* devoid of matter relating to the rear springing of motor cycles. For some months past hardly a week has passed without a description appearing of a new device, and our correspondence columns have contained many instructive letters on the subject. However, the matter is not being dropped, and the numerous readers who are so interested in rear springing will have further opportunities of studying new systems and taking part in the discussions involved.

Twin-cylinder Two-strokes.

During last winter the Connaught Co. produced a horizontal twin two-stroke engine, a type with which a number of manufacturers are experimenting. The latest production of the firm is a V-type twin, which to all intents and purposes is two engines coupled together and mounted into a special frame. The latest engine is rated at 5 h.p., and has a capacity of 586 c.c., the bore and stroke being the same as the standard Connaught, viz., 73×70 mm. It will be interesting to observe its performance on the road.

Incidentally the two-stroke twin is now attracting much attention. Of the vertical type there are the Scott, Premier, and Allon, and of V-type two-stroke engines we have the Sun-Vitesse and Peco. The best known horizontal twin two-stroke is the Levis, though several other makes are under test on the road.

MOTOR CYCLING IN DENMARK.

(Upper) Five Rudge riders who took part in the Danish Grand Prix. It will be noted that they are using standard machines. This make has been very successful in Danish motor cycle competitions.

(Lower) A club meet in Denmark. All the machines are Rudges, and it is known as the Rudge club.

Justice?

A case has been brought to our notice in which a despatch rider unfortunately exceeded the speed limit in Sheen Road. Although it was his first offence the magistrate fined him £5. The soldier's mother, in writing to the Richmond magistrate, thanked him for the unjust fine on her son, and said that the magistrate thus deprived the lad from being able to purchase the few luxuries he required before facing many hardships. *John Bull* says, "We do not envy the feelings of the magistrate when he read that rebuke signed by 'His Mother.'" From every point of view the fine was mercilessly severe, and we regret to say we have had similar complaints from other despatch riders to whom no leniency has been shown. Apparently mercy does not temper justice when applied to motor cyclists in Surrey.

HOME OFFICE ORDER FOR REDUCED LIGHTING.

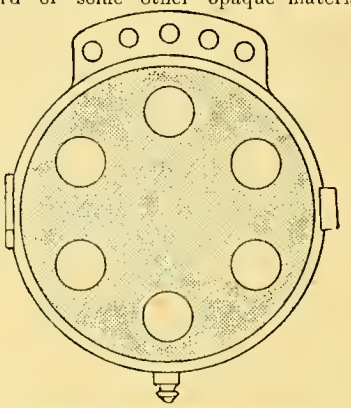
PROPOSED STANDARDISATION OF LIGHTS.

As suggested in a leading article in *The Motor Cycle* last week, a new Home Office Lighting Order is to be issued shortly, by which it is hoped the difficulties arising from the present chaotic lighting restrictions will be reduced. According to the A.A. and M.U., all restricted areas in England and Wales will be divided into two classes, the names of which will be scheduled. In all districts except those mentioned in the schedule, and certain important military centres, there will be no restrictions on lights at all beyond those obtaining under ordinary conditions.

New Regulations.

The exact conditions of the new Order are not available for publication at the moment, but it may be stated that in all districts mentioned in the schedule motor car head lights of any kind will be entirely prohibited, while in one class of restricted area side lights may be used up to a power provided by the Order, but also subject to obscuration, together with motor cycle lamps, if necessary.

In the second class of area lights must be still further reduced by means of an official type of disc made of cardboard or some other opaque material;



Design of lamp shade which may possibly be officially adopted.

this disc will be 6in. in diameter, with six holes each the size of a shilling. Lamps with a glass larger than 6in. will not be permitted.

Lighting-up Time Earlier.

Under the proposed new Order all vehicles will have to show a rear red light provided by means of a lamp placed at the back of the vehicle. More than two lamps showing lights to the front will not be allowed on any vehicle. Lighting-up time will also be half an hour after sunset throughout the country, instead of only in London as at present.

This new Order does not apply to the Metropolitan or City of London police districts. To assist motorists in knowing when they are entering the restricted areas, the Home Office will ask local authorities to display certain distinctive signs on the street lamps similar to those supplied by the Automobile Association, and now fitted in the lamps of many towns and districts where strict lighting restrictions have prevailed.

"THE MOTOR CYCLE" RECRUITING SECTION.

THE fact that practically all motor cyclist sections are closed for recruiting has caused great regret among prospective recruits, particularly in view of the special efforts of the past few weeks and the possible termination of Lord Derby's scheme next Saturday. The position, however, is not generally understood, and we will endeavour to explain it.

The Royal Engineers is the only section taking motor cyclists at present, and the requirements are restricted to ten men from each recruiting area every month. To supply this regular demand, in most cases there are sufficient names of eligible men on the different waiting lists. These men have waited patiently for weeks past.

The Motor Machine Gun Service, for which the Editor of *The Motor Cycle* has acted as recruiting officer, is up to strength, and recruiting closed a fortnight ago.

The Royal Flying Corps closed for motor cyclist recruits three weeks ago.

The A.S.C. is open for fitters and turners only.

It will thus be seen that at the present time there are limited vacancies for motor cyclists, though when the R.F.C., M.M.G.S., R.E., and A.S.C. were open some weeks ago there was a regular weekly influx of dozens of motor cyclist recruits

Last October, when certain R.E. areas were appealing for recruits and other areas were turning eligible men away, we urged the desirability of a central control for recruiting motor cyclists, and subsequently wrote the War Office on the subject. The A.C.U. secretary, Mr. T. W. Loughborough, who is secretary of the London Motor Cyclist Reserve Committee, thoroughly concurred in our views, and, moreover, drew up a scheme for submission to the War Office.

As to the procedure in connection with motor cyclists and the new recruiting scheme, Mr. S. W. Phillpott, of Liverpool, seems to be the only inspecting officer who has received detailed instructions (see page 586).

MOTOR MECHANICS WANTED.

THE Wireless Section R.E. has vacancies for about thirty-six motor mechanics with good practical knowledge of petrol engines. Applicants for these positions must be able to carry out repairs to such engines in the field. Applications for enlistment, stating qualifications, should be sent to the O.C. Wireless Training Centre, Worcester, from whom information regarding terms of service can be obtained.

Men would be required to enlist as sappers in the Wireless Section of the Royal Engineers.

A despatch rider, Corporal H. Akehurst, R.E., photographed by a French refugee after a long run over the roads of Flanders. The state of the Triumph indicates the mud-covered condition of the roads over there after a period of rain, and Corporal Akehurst considers that one requires to be a trick cyclist to negotiate *pave* under such conditions.

THE ORIGINAL BATTERY.

NO. 1 Battery, M.M.G.S., is still going strong, and according to Sergeant Norman Longfield there are very few "lightweights" left, which speaks well for the commissariat in France. What helps to brighten matters is the unexpected meeting of motor cycling friends, and in this connection Longfield tells us that during the past few weeks he has met many men well known in the motor cycling world, including Lieut. Rowlandson and Lieut. Colliver.

Lance-Corpl. A. Wade (a former Zenith rider) is now with the No. 1 Battery, and is putting in some splendid work in the maintenance of the outfits. He has just had a week at home after thirteen months on active service. He had quite a good time, not the least enjoyable being a dinner given in his honour by Cardiff motor cyclists.

MIDLANDERS ON SERVICE.

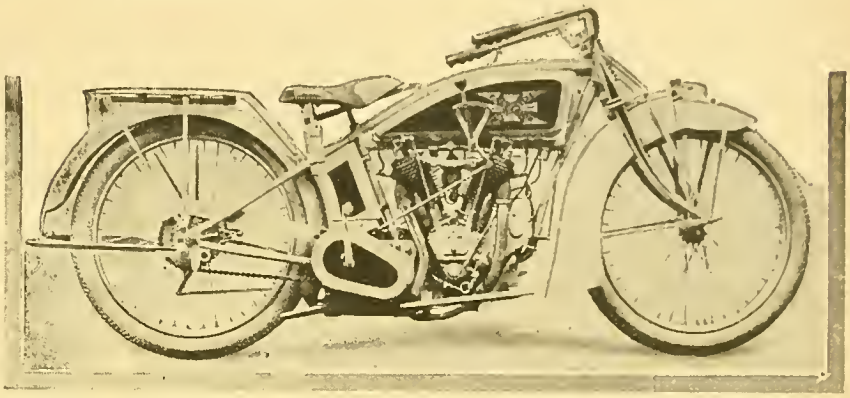
THE Colmore Depot has a roll of honour of thirty-two—an excellent record—and quite recently it honoured three of its men by a complimentary supper, Corporal J. Merton, who has had a son killed on the Gallipoli Peninsula, and Drivers H. J. Woodgate and A. Rowley being the men in question.

Refinements in the 1916 American Excelsior.

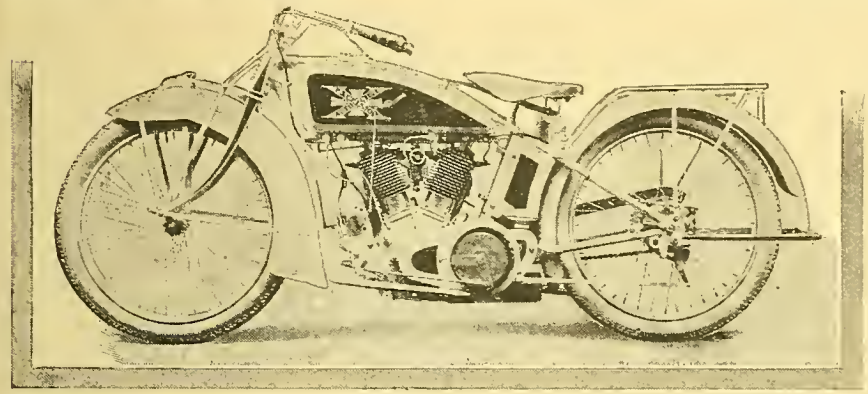
7 h.p. Twin-cylinder Engine, 84 mm. × 89 mm., 986 c.c. Three-speed Gear and All-chain Drive.

THE Excelsior has certainly had a good reception since its introduction to England, and we can speak of its excellent running after personal trial. The 1916 model has not undergone many alterations, and this was hardly to be expected, as the 1915 pattern did not lead one to suppose that there would be many features which could be altered for the better.

A refinement on the new type, which, however, is not obtainable at the present moment, is a new priming device, consisting of a T piece union screwed into the bottom of the petrol tank. From this there are two branches, one of which goes to a point close by the inlet valve dome on the back cylinder, and the other to a similar point on the front cylinder. The supply of petrol is controlled by a small needle valve, brought into operation by turning a milled screw.



1916 model American Excelsior, the chief points of interest of which are described in the accompanying letterpress.



Near side of the latest 7 h.p. American Excelsior. A 986 c.c. engine and a three-speed countershaft gear with all-chain drive are features of note.

The graceful design of the frame is another point worthy of mention, and it will be seen that the top tube is produced to coincide with the line of the back forks, thus rendering the design quite symmetrical. It will be noticed that, incorporated with the frame are eyelets into which the sidecar attachments are fixed. An efficient form of leaf spring fork is fitted.

Method of Control.

As regards control, the twist grip on the off side raises the exhaust valve in one direction, and when twisted the opposite way opens the throttle, while the near side grip controls the clutch, which is also actuated by foot. The small lever adjacent to the clutch control grip is for the operation of one of the two brakes, both of which work on the same drum, the other being operated by means of a pedal. One is internal expanding, and the other is of the contracting type.

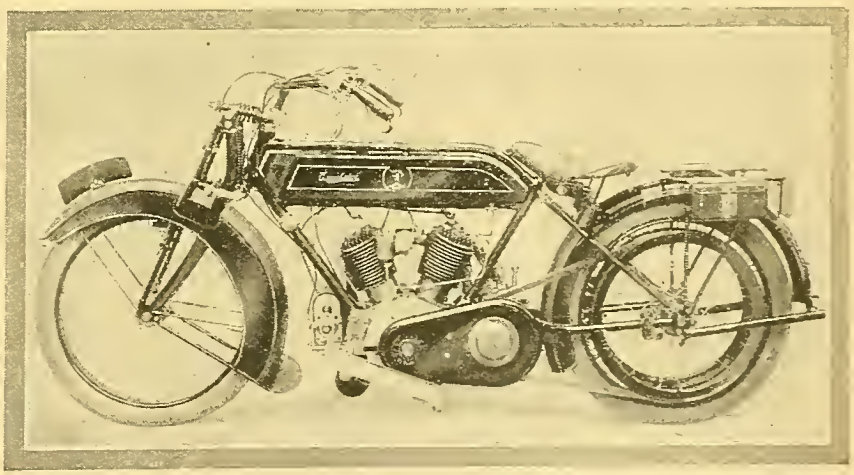
The compression valves on the off side of the cylinders are still retained, as is also the petrol squirt incorporated in the filler cap. This filler cap, by the way, is no longer flush with the tank, but has been raised considerably above it, so that it is much easier to unscrew.

A novel feature is the fitting of the kick starter on the off side of the machine. Formerly it was on the near side, as in America. The sidecar is placed on the opposite side of the machine to what it is in England.

The Lubrication System.

The usual American system of mechanical oil pump, keeping a constant level of lubricant in the crank case, is employed. Below this pump there is a T piece union, at the end of the upright of which there is a small screw. This is a good feature, as it is intended, when the screw is removed and the engine is set in motion, to free the oil pipes of air locks, and as soon as the oil makes an appearance the screw can be replaced, and there will be no doubt about the pump doing its duty. There is also a special lead carrying oil to the front cylinder.

A CHAIN-CUM-BELT-DRIVEN BRITISH EXCELSIOR.



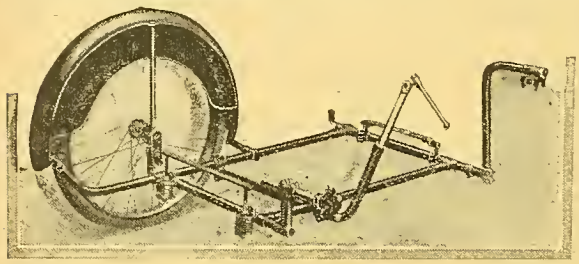
Fitted with an 8 h.p. J.A.P. engine, a three-speed countershaft gear, and chain-cum-belt transmission, the latest Excelsior is a fine specimen of a powerful British twin.

SOME NEW SIDECAR ATTACHMENTS.

Lightweight Chassis Design—A Collapsible Body.

WATSONIAN SIDECAR CHASSIS.

THE four new bodies designed by the Watsonian Folding Side Car Co., Ltd., have been described already (issue of November 11th, page 468), and for these models a new lightweight chassis has been evolved. As will be seen in the photograph of the chassis, the main frame is rectangular, having the axle at one end and at the other a cross tube on which are the supports for the nose of the body, while the offside tube of the frame is extended to form the rearmost support of the mudguard. Since this tube is of the same diameter throughout its length, it forms a very stiff support indeed. Attached to the forward cross tube is a supporting tube adjustable for height in a lug near the frame, and locked when in position by two bolts. Near the axle comes the rear supporting tube bolted to the frame, while the axle end also is clipped to the motor cycle frame, but with a telescopic joint for aligning the sidecar and motor cycle.



New lightweight sidecar chassis built by the Watsonian Sidecar Company and described on this page.

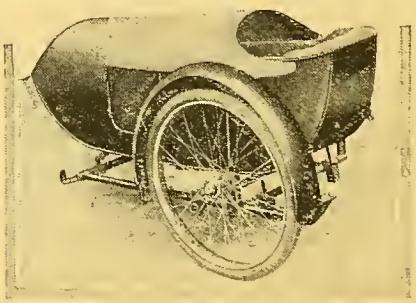
To make it easy to detach the sidecar all joints are made up with one big securing nut, an easy fit on its thread. The back of this nut is serrated, and there is a small spring-held pawl to engage with the serrations, thus forming a ratchet and making it impossible for the nut to come unscrewed. By holding back the pawl one can unscrew the nut by hand and without using a spanner.

This chassis has a 5in. drop between the wheel-spindle and axle, obtained by designing two special malleable cast brackets of strong section, and securing one end of the bracket to the axle tube, while the other holds the one inch spindle. Stiffening webs are employed for the bracket next to the motor cycle.

From the top of the wheel-spindle bracket a short rigid tube supports the mudguard, while a third support is a small bracket bolted to the frame and secured to the forward end of the guard.

Either coil springs or Cee springs may be fitted, the former being connected to a bar running athwart the lower side of the body, the latter clipped to the side tubes, the nose of the body resting on a cross-bar pivoted to allow the body to rock freely on its springs. With the Cee springs long shackles are used.

With 26in. × 2¼in. Michelin tyres, a 2½in. drop, and weighing 46 lb., this chassis is fitted with the "Tourist" model body. The same chassis having one more connecting tube, a 5in. drop, and weighing 50 lb., is used for the "Aero" sporting model.



Watsonian "Aero" sporting model sidecar.

The coachbuilt "Aero" body weighs but 29 lb., and the complete sidecar is built for use with 3½ h.p. machines when weight must be kept at as low a figure as possible.

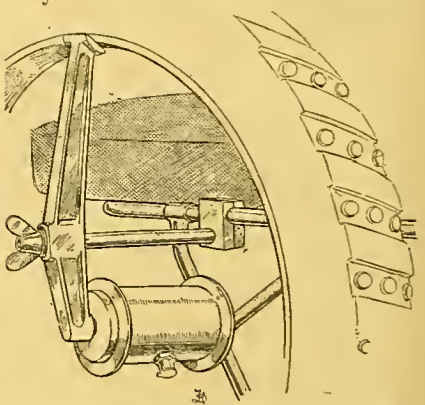
The following sidecars were described in our last issue:

HENDERSON	page	547
BRITANNIC	„	547
MONTGOMERY	„	547
IVY BATH CHAIR SIDECAR	„	548

MONTGOMERY FOLDING SIDECAR BODY.

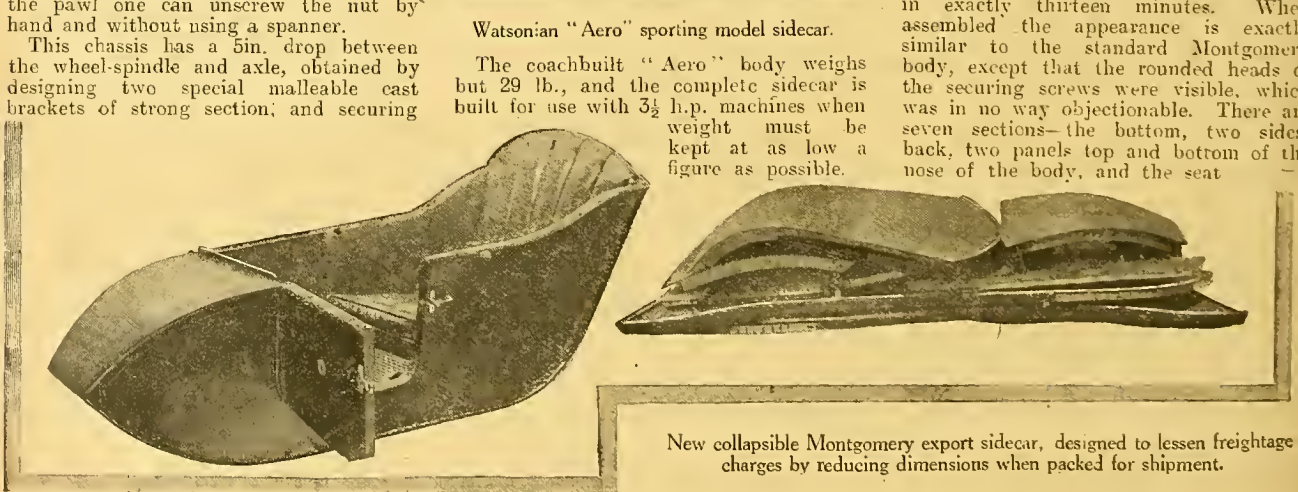
Made in Sections to Reduce Cost of Export.

THE cost of exporting such articles as sidecar bodies is always rather expensive owing to their bulk, which in comparison with their weight is very considerable, and this extra cost is naturally more noticeable under the present conditions of increased shipping charges. In order to reduce this as much as possible, Messrs. Montgomery and Co. have recently brought out a novel coachbuilt sidecar body which will take to pieces and pack into a very small space; in fact, Mr. Montgomery informs us that five of these bodies can be packed into rather less space than that previously occupied by one complete body.



CLYNO DETACHABLE WHEEL SUPPORT.
The quickly detachable fixing for the spare wheel, which is fixed on the off side of the carrier

The body is complete with door fastenings, upholstery, tool locker, paint and varnish. All that has to be done when the body arrives at its destination is to assemble it and fit the screws which hold it together. No skilled labour is required, and we saw two men fit one together in exactly thirteen minutes. When assembled the appearance is exactly similar to the standard Montgomery body, except that the rounded heads of the securing screws were visible, which was in no way objectionable. There are seven sections—the bottom, two sides, back, two panels top and bottom of the nose of the body, and the seat



New collapsible Montgomery export sidecar, designed to lessen freightage charges by reducing dimensions when packed for shipment.

The Editor does not hold himself responsible for the opinions of his correspondents

All letters should be addressed to the Editor, "The Motor Cycle," Hertford Street Coventry, and must be accompanied by the writer's name and address.

Carburetter Adjustment.

Sir,—I was interested in Mr. W. Hockney's letter under the title, "Reversing a Scott." I, too, have lately been riding a Scott, but am unable to get anything like the mileage per gallon that he can. With a passenger on the carrier I get about 54 m.p.g., riding solo about 60 m.p.g. The machine is fitted with a Binks two-jet carburetter, and I drive as much as possible on pilot jet, from which I can get any speed up to 24 m.p.h. Owing to increased price of petrol, I am very anxious to get a big mileage per gallon. Perhaps you could put me into direct communication with Mr. Hockney, who would, no doubt, be quite pleased to give advice or hints to a "fellow Scott" as to how he manages to get about 100 m.p.g. riding solo. V. B. YEARSLEY.

Sir,—I noticed in the last issue of your paper (December 2nd) a letter written by W. Hockney, which appears under the heading "Reversing a Scott." In the latter part of his letter Mr. Hockney says that he is getting a mileage of seventy-five to one gallon of petrol on his Scott with sidecar attached, his carburetter being a 1915 B. and B., which is, I presume, of the variable jet type, specially adapted for fitting to the Scott.

A few months ago I had a 1915 B. and B. semi-automatic variable jet carburetter fitted to my Scott, which is a 1913 model. After several adjustments of the needle I can, with careful manipulation of the air lever, obtain a mileage of forty-five to one gallon, with sidecar attached and one passenger.

I should be pleased if Mr. Hockney would inform me as to how he has adjusted his carburetter to give him his mileage of seventy-five per gallon, which is, I should think, a record small consumption for a Scott, which is acknowledged to be fairly heavy on petrol.

I may say that the carburetter has effected a great improvement in the starting of the engine, about three kicks being sufficient to set the engine purring, even during the severe frost of a few days ago, without having to press the "tickler." JAMES F. STANLEY.

A Tip to Indian Riders.

Sir,—I dare say a good many riders of 1915 Indians are troubled with the way in which they rev. when in free engine. Of course, it not only means unnecessary wear on the bearings and every part in general, but in these hard times it is not exactly economical. Now this is my idea after having tried choke tubes and various other devices which all failed.

As is well known among all Indian riders, the carburetter has two jets, and all the slow running is obtained from the smallest of these two jets; each jet having a separate induction pipe.

Now take the pilot jet induction pipe, cut it at the top and bottom, and you will have the centre piece out. Now at any motor cycle dealer's buy an ordinary tap and solder it to the two ends of the pipe and you have a separate throttle to the pilot jet, so that when you are held up in traffic or on any other occasion your engine will tick over slower than a cart, and take you along at a walking pace. I myself know about ten people who have copied my idea and they consider it a great boon. To improve matters, control this by Bowden wire and a magneto control on the handle-bar. I trust you will publish this, as I worked a month to satisfy myself, and I dare say there are many others who will find this useful. G. H. GIBBS.

Paraffin as a Fuel.

Sir,—It may be interesting to you to know that the writer, doing approximately 1,000 miles per month, is using nothing else but half household paraffin and half Crown spirit, with perfect results. An experiment was carried out gradually adding paraffin to the petrol until a mixture of threequarters paraffin and one-quarter petrol was arrived at. This answered quite well once the motor was started, but a very dirty exhaust was the result, and some difficulty in starting on a cold morning. After the engine had been warmed up this mixture was as easy to start as pure petrol. However, to get rid of the bad effects as mentioned above, the half-and-half mixture was finally decided upon. The only difference perceivable is a very slight falling off in power, and perhaps about ten yards further run with the engine in the morning before it fires. Of course, the easiest way to overcome all these difficulties is to fill the carburetter in the morning with pure petrol, then a greater proportion of paraffin to that which the writer uses can be adopted, but, as a rule, this method is too much trouble.

The above is used on a 2¾ h.p. T.T. Douglas with Amac carburetter. The writer knows of an 8 h.p. twin Premier being run on pure paraffin, the rider only having to fill his carburetter with pure petrol in the morning. A mixture of benzole, Jones's Xl'All, and paraffin seems to give the same results as petrol-paraffin, but the benzole gives greater trouble on a cold morning in freezing up.

F. R. SWINBURNE.

Sir,—I note the enquiry in your issue of the 11th inst. as to the harmful effects, if any, resulting from the use of paraffin alone or mixed with petrol. The suggestion of a motor manufacturer that unburnt paraffin escapes past the rings into the crank case and there dilutes the lubricant is no myth, but actual fact. Some particulars of a case

Despatch riders with their respirators in position. The photograph was taken on the Gallipoli Peninsula.

which came to my notice may be of interest. A boat was fitted with a pair of six-cylinder engines running on paraffin fuel. In one set the results were good, but in the other, although apparently under similar conditions, the bearings were wearing out quickly. The lubricant was, of course, suspected, and, in the case of oil drawn from the sump of the troublesome engine, there was a smell of paraffin, and tests showed the presence of this fuel in small quantities. After making sure that fuel could not possibly have been added to the engine oil, I suspected the carburetter, and was informed that, after recent adjustments, the fuel consumption had increased. Further, I elicited the information that whereas, in the case of the satisfactory set, the sparking plugs rarely needed attention, in the other set the sparking plugs had to be cleaned of sooty deposit daily. It was soon proved that the carburetter on the faulty set was giving too rich a mixture which was incompletely burnt, and that a portion of the fuel was condensing on the cylinder walls and percolating into the crank case, assisted, of course, by the oil film between the pistons and cylinders. The efficiency of the lubricant was quickly spoilt and wear of the bearings resulted.

Proper heating and accurate adjustment of the carburetter are essential in the case of paraffin or paraffin and petrol or benzole mixtures. Similar precautions should be taken in the case of benzole, and under all conditions the lubricant in the crank case should be changed more frequently than when petrol is used. Incidentally, one may remark how closely carburation and lubrication are related in the running of internal combustion engines. J. W. G. BROOKER.

Clutch Operation and Transmission.

Sir,—It was with great pleasure I read the letter from Mr. A. I. Dowler in your issue of the 2nd inst. "Ixion's" contention that the handle-bar clutch takes a lot of hauling out is certainly wrong when that remark is applied to the Sunbeam models for 1915, and, in my opinion, it is essential with a sidecar combination for the handle-bar clutch to be fitted.

I began motor cycling in July, 1913, when I purchased a Wall Auto-wheel. This I ran for four months, and during that period the only troubles I had were an occasional sooted plug and punctures. In October, 1913, I bought a well-known 3½ h.p. single and sidecar, belt drive with hub gear and foot control clutch. This was a 1913 model, and had done 600 miles when it was sold to me. I had it three months and did 700 miles, averaging 35 m.p.g. During that time I spent £10 odd for repairs and tyres. I found that it was not desirable to attempt a restart on a steep hill, as it nearly always ended in failure because the engine could not be relieved of the taking up of the load to any extent, as I had to be seated in order to let the foot clutch in.

Early in February, 1914, I purchased a 6 h.p. Sunbeam 1914 combination, and during the fifteen months I had it I did 6,300 miles. I averaged 72 m.p.g. during a tour of 1,009 miles in the summer of 1914, from Cardiff, over Dartmoor, to the Isle of Wight, and as far as Eastbourne. It was during this tour I found the advantage of the hand clutch. I was on the steepest part of Birdlip when the front plug became sooted up. I stopped and put a stone under the back wheel, and put the plug right. I restarted at the first attempt because I was able to ease the strain by pushing as I let the clutch in. The total weight during this tour was 8½ cwt. When I sold the combination the original chains and the front and sidecar tyres were on it. R.O.M. combination, 700×80 mm., were the tyres. I spent £2 on repairs, excluding tyres, and had one puncture for the fifteen months.

In May this year I purchased a 6 h.p. Sunbeam 1915 combination with Lucas dynamo outfit. I average 58 m.p.g., and up to date I have done nearly 4,000 miles, and have just replaced the back tyre; the original tyres are on the other wheels. I again use the oversize R.O.M. tyre, and have not had a puncture. There is a vast difference between the Sunbeam 1914 and 1915 clutch control. I grant the 1914 did take a bit of hauling out, but the 1915 control a child could lift. My repair bill for the 1915 combination is 3s. 6d. so far, and this month I am exchanging it for the 8 h.p. Sunbeam 1916 model. I have always carried complete spare chains, but have never had to use them.

I add the usual disclaimer. R. WILFRED REES.

A Catch?

Sir,—With reference to Mr. F. G. L. Evans's wish expressed to "Ixion" to pit a 7 h.p. F.N. and sidecar with three up against a Henderson solo in a speed contest, if this is really a serious challenge from Mr. Evans, I shall be pleased to ride my Henderson against his little lot as described, the loser to pay £5 to one of the war charities.

In view of the terrific speed Mr. Evans presumably expects to obtain from his overloaded machine, I am afraid that Brooklands track in its present condition might prove dangerously bumpy for him, but a stretch of road might be found to accommodate him. Unless Mr. Evans insists, I would agree to waive the half a mile start offered.

VIVIAN OLSSON.

The Lady Motor Cyclist.—A Protest.

Sir,—*Apropos* the controversy with regard to feminine attire, there are, in my immediate vicinity, three examples which would appear to cover the extreme range of taste. The first is an elderly female who rides a powerful sidecar combination. She wears a mackintosh jacket of the sloppy, waistless sort, and heavy boots. The lower portion of her attire may be, from all appearances, shared by the partner of her private life (possibly this is a step towards economy necessitated by the war!) Huge spectacles and an aggressively unbecoming headgear complete this rig-out.

The second case is that of a younger woman who wears an ordinary male suit of overalls and an ordinary common (very common) peak cap. The latter is anchored down by something that resembles a skewer, and is strikingly reminiscent of washing day in the back kitchen!

The third case is that of the youthful rider of a Rudge. She wears well-cut riding breeches, and a long-waisted jacket reaching almost to the knees. A smart leather belt and high brown boots to match put the finishing touches to this graceful, easy, and becoming attire.

Why does "Logistes" blunder into sarcasm because Mary Reid, very naturally and desirably, wishes to "sit her steed with gracefulness"? The "logic" of the first-named correspondent is, apparently, to the effect that in abandoning the skirt, the high heels, and the stays, the woman of enlightened ideas will further make a point of discarding everything womanly and graceful, in order that she may rise to the proper and dignified standing to which she rightly belongs!

The allusion to the Empire robe is on a par with the other points of "logic," and I certainly do not think that the practical woman, who aspires to be man's chum, would go about it by copying his garments to an extent which would entail the sacrifice of prettiness and grace.

PRO BONO PUBLICO.

Miss Anna Blakiston, of Dore, Derbyshire, who rides a two-stroke Revere. She favours a man's model, and wears ordinary trouser overalls.

A Cure for Four-stroking.

Sir,—I read with interest Mr. R. S. Carr's "Cure for Four-stroking" in your issue of November 25th, and, as I also have a two-stroke motor cycle, I should be much obliged if he would state a few more particulars as to these fitments. What kind of non-return valve is best, and how is it fixed into the induction pipe? What is the cost of having the extra air valve and the non-return valve fitted?

D. G. COSSHAM.

Broken Spokes.

Sir,—I noticed in *The Motor Cycle* for November 18th, under heading of "Letters to the Editor," an enquiry from a Mr. Wild *re* broken spokes.

I assume the machine he refers to is a 1914 Indian spring frame model, for undoubtedly this particular mount is a bad offender; only after many experiments have I managed to arrest the very annoying trouble. I took the wheel out of the frame, and, with a pair of pliers (not the usual spoke spanner), carefully trued up all the spokes to their correct tension. I then lapped all the spokes at the crossing on the driving sprocket side with copper wire, and soldered it in position. (This prevents whipping, which is usual when the wheels are built in the American way, viz., outside spoke on outside of inside spoke instead of the reverse.) The clutch must then be carefully adjusted so as to give slight slip under power of engine immediately on release pedal being pressed forward.

I think if your reader will try this method he will be surprised with the results. I never have a spoke break at all now, even though I often carry a third passenger weighing 9 st. I might also mention that with the spring frame Indian the clutch should always be very slightly released when going over pot-holey roads, otherwise nothing will prevent spokes from going.

I believe I am right in saying that the Indian people introduced a hub in their early models making it possible to insert a new spoke with the wheel *in situ*.

ROBERT RUSSELL.

A COPY OF THIS LETTER WAS SUBMITTED TO THE HENDEE MANUFACTURING CO., WHO REPLIED AS FOLLOWS:

Sir,—We are in receipt of your favour of November 23rd in regard to spokes breaking on Indian motor cycles.

We think the trouble is caused entirely by riders running their machines with the clutches too tight, though, we are pleased to say, we have had practically no complaints in this respect for the past year, undoubtedly due to the fact that motor cyclists are getting more familiar with the chain drive.

Some years ago we used a buttonhole spoke attachment in the rear hub, but we found this was not satisfactory, for the reason that it gave the heads of the spokes considerable movement, which had the tendency to snap them off.

It is our firm belief that if the clutches were adjusted so as to give a slight slip, riders of Indians, as well as of other chain-driven machines, would have no cause to complain of spokes breaking.

HENDEE MANUFACTURING CO.,
W. H. Wells, Manager, London Depot.

Sir,—*Re* "Wild's" experiences with his big twin, I should like to suggest that the breaking of his spokes is mainly due to hanging on to top gear with a large throttle opening at low speeds. This causes the engine to "chug," and a "snatchy" drive results. This trouble seems rather peculiar to American machines, as, owing to their great flexibility, their riders are apt to use the top gear when it would be much more practical, if a little troublesome, to change down to middle.

INDIAN EX.

Sir,—Seeing your correspondent's ("Wild's") letter, and having experienced the same trouble with my 8 h.p. chain-cum-belt drive twin, namely, broken spokes at the bend, I think that perhaps my remedy may cure his case also if he care to try it.

I suggest that he take out his back wheel and examine it most carefully to see if every spoke is taking its fair share of the pull. To do this he should grip two spokes with his hand close up to the belt rim, watching very carefully for any movement between the spoke and the clip, which in my case was a small plate and two bolts. I fancy he will find, as I did, after having been all round the wheel, that not more than one half of the spokes are actually gripped by the plates, as their faces are flat and smooth. On my machine the reason was because the bolts were not threaded far enough down. I therefore purchased new bolts with the threads running right down to the heads, removed one plate at a time, after marking the position of the spoke, and cut a slight groove to allow the spokes to bed themselves down into the plates when screwed home tight. I have done four thousand miles with the machine since, and the trouble has completely vanished.

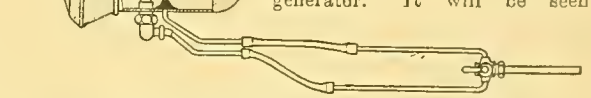
I might mention that the agent from whom I purchased my machine was at a loss to find the cause, although he had ridden the machine for a season prior to selling it to me, and admitted he was continually replacing broken spokes himself.

SECOND YEAR RIDER.

Dimming Bright Lights.

Sir,—In view of the existing regulations for dimming head lamps, I have had the following conversion made to my big F.R.S. Actually it comprises a pilot light, which was constructed in the following manner:

About 3in. of $\frac{3}{16}$in. brass tube was tapped out at one end to take a Lucas tail lamp burner. This was then soldered in a hole in the face of the lamp, so that the main burner and pilot were within $\frac{3}{16}$in. of each other (see sketch).



Pilot light fitted to acetylene lamp to meet dimming regulations. See letter on this page from Mr. D. H. West.

The main gas tube along the top of the tank was then cut about midway, and a two-way tap inserted, the two tubes from this tap being connected to the two burners and the single one to the generator. It will be seen that a turn of the tap will supply gas to either burner, and once alight the main burner will light off the pilot jet and *vice versâ*.

The addition can be made at a very small cost, and will amply repay the trouble taken. Its advantages are obvious, and when approaching a town it is only necessary to turn the tap on to the pilot light (which cuts off the main burner), and in the country one can enjoy the maximum light.

DOUGLAS H. WEST.

Reversing a Scott.

Sir,—With regard to your paragraph in October 28th issue, the following incident which happened to me may be of interest to your readers, and perhaps someone can offer an explanation for it.

I ride a 1914 Scott and sidecar fitted with a Bosch magneto. I was driving this machine into my garage the other night when I accidentally stopped the engine at the door. I started up with the kick starter in the usual way, and, as there is a stiff rise at the door, I speeded the engine up before engaging the low gear, which I did rather quickly. I was very much surprised when I was somewhat rudely carried backwards into a rose bed. For some time after that I could not be certain whether my engine was running the right way or not till I let the clutch in, but now in some mysterious manner the fault has disappeared.

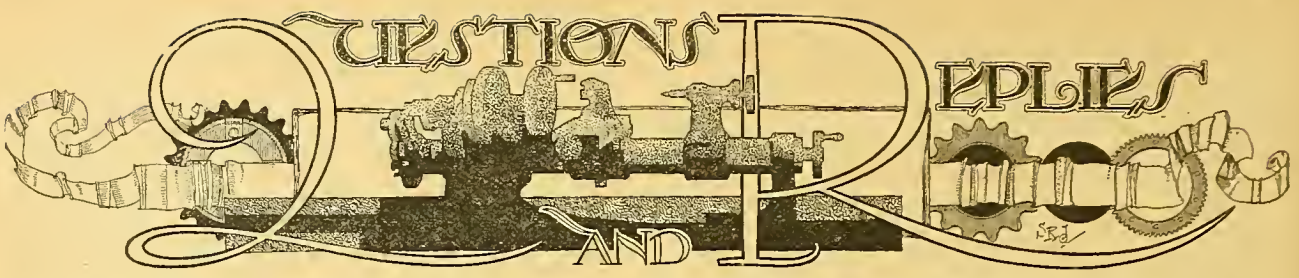
May I add a word of praise for my Scott, which has carried me 17,840 miles in seventeen months, and has never let me down on the road, and has cost nothing for repairs, except a new set of chains and tyres?

With reference to "Scot's" letter in October 28th issue, I may say I have tried mixing the petrol and oil on the Scott machine, and have noted carefully the results.

The acceleration was not so good, the machine was not quite so fast, the petrol consumption was considerably increased, and the machine was inclined to four-stroke at slow speeds, so I had no hesitation in going back to the drip feed.

Need I add that I have no connection with the Scott Co. whatever?

GEORGE ALLEN.



A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, London, E.C., and whether intended for publication or not **must be accompanied by a stamped addressed envelope for reply.** Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

Use of a Decompressor.

I should be obliged to you if you would explain to me the advantage of a decompressor. Would not opening the compression tap serve the purpose? Also, I should like to know if there are any means of preventing belt slip in wet weather on a 2¾ h.p. direct-drive machine.—T.J.

A decompressor reduces the compression so that the engine is very easy to start; it does this by permitting a certain portion of the gas under compression to escape. The compression tap would not answer the same purpose, as it would also upset the quality of the mixture by permitting air to enter the cylinder on the induction stroke. There is no satisfactory method of preventing a rubber belt from slipping in wet weather. A leather belt is less likely to slip than a rubber one.

A Mysterious Trouble.

I have a 2¾ h.p. twin with a two-speed gear, which was running well until the other day, when it suddenly ceased firing, and, having tried everything without result, I pushed it home. I am unable to get a spark at the plugs at all, but upon removing the magneto from the machine I get a beautiful spark at both plugs, without making any alteration to the magneto and using the same plugs and high-tension wires. Upon refitting the magneto to the machine and trying it, I again failed to get a spark, or even a shock when I held my finger on the magneto terminal. I again removed the magneto from the machine and, without any alteration, tried it, and at once got perfect sparking at both plugs. I may say that the magneto is a 60° 1913 Bosch, which is clamped behind the engine on the frame just behind the countershaft. I have tried to see if I could find a short by pedalling it over in the dark, hoping I might see a spark on the frame or somewhere, but this was also without result. I should be glad if you could enlighten me on this matter.—H.W.D.

Evidently there is a short circuit somewhere when the magneto is in position, but it is impossible for us to say where without actually seeing it. If a switch wire is connected up when the magneto is fitted to the machine, the short circuit is almost certainly somewhere in this wire. You should disconnect it from the magneto and see if matters improve. The mere fact of just bolting the magneto into position should not affect the spark in any way. Make quite sure the high-tension cables are in perfect order and not shorting to the frame anywhere. If these points are in order, the trouble is probably due to the windings being broken down, but the fact that you get a spark when the machine is not in position is certainly very difficult to explain.

Erratic Running.

I have a 1905 Rex with automatic inlet valve, and fitted with an old pattern B. and B. carburetter. If I inject a good squirt full of petrol, it will start easily and run for thirty or forty yards, but will then stop firing suddenly, and refuse to start again till another injection of petrol is given; it will then do exactly the same thing again.—E.A.H.

The trouble is most likely caused through a stopped-up jet. Therefore the engine simply runs on the petrol you have injected into the cylinder, and when this is exhausted it ceases to fire. It could also be caused by an air leak in the induction pipe or carburetter unions. You should thoroughly clean the carburetter, and see that all passages are free from obstruction, and that all joints between carburetter and engine are tight and not admitting air. See that the valve springs are quite strong and valves are not sticking.

Cause of Difficult Starting.

I have a 1912 6 h.p. twin with kick starter and two-speed gear. Some little time ago I had it re-bored, and new piston, rings, gudgeon pin, and a 1915 carburetter fitted. It has run well up to a week or so ago, but is now very difficult to start. I have fitted new plugs and bound all joints in induction pipe to stop air leaks, and have cleaned carburetter, but with no effect. The only way I was able to start last time was to get two to push and then put in low gear.—E.P.

Difficult starting may be due to any of the following points: Carburetter partially choked. Plug points dirty or too wide apart. Carbon brushes on magneto oily. High-tension wires damp and shorting. Switch wire shorting; to test this detach switch wire from magneto. Rocker arm on contact breaker sticking owing to the fibre bush swelling. Make sure that the valves are seating properly and are not leaking at all. If all these points are correct and you can obtain a spark at the plugs when you test them by placing the body of the plug on the cylinder, taking good care not to let the terminal touch any part of the frame, and turn the engine over fairly fast, there is absolutely no reason why the machine should not start quite easily. You should go over the machine systematically, testing each part separately. If the engine is stiff, and so makes it difficult to turn over, you should inject a little petrol or paraffin through the compression taps, and then turn the engine over a few times to free the rings.

Loss of Power.

(1.) My 3½ h.p. machine will carry me and a passenger up any hill shortly after starting and before the engine gets heated—in fact, I need not open the throttle more than half-way—but after it has been on the road for a while it seems to lose power and will not take even small hills. I recently ground in the valves, but this did not cure the trouble completely, although it improved it. (2.) I cannot possibly start the engine on any speed without first injecting petrol; the piston seems to stick the minute the engine gets cold. I use a good oil, but perhaps it is too thick. (3.) I have steel-studded tyres on both wheels, and if the roads are dry all the patches melt off the inner tubes.—M.P.L.

(1.) Apparently the valve stems expand with the heat, so that the valves do not seat properly, and thus the compression is lost. The remedy is to adjust the tappets. A smaller jet might be advisable if you suffer from overheating. (2.) Possibly the piston is too tight a fit in the cylinder. The rings being a tight fit or stuck in their grooves with carbon deposit might also cause the trouble. When rings are fitted into the cylinder the ends should not quite meet. (3.) You had better give up using steel-studded tyres in the summer time. These cause the patches to come off the tube, as they generate so much heat.

SPECIAL NOTICE.—*Copies of "The Motor Cycle" may only be sent to neutral European countries if posted direct from the offices of the publishers, or by newsagents who have obtained permission from the War Office for this purpose. The publishers of "The Motor Cycle" have obtained the necessary permission, and, consequently, can send subscribers' copies as usual. Before sending through newsagents it is important to enquire if permission has been obtained, as otherwise copies intended for neutral European countries will not be forwarded by the Post Office.*

Uneven Running.

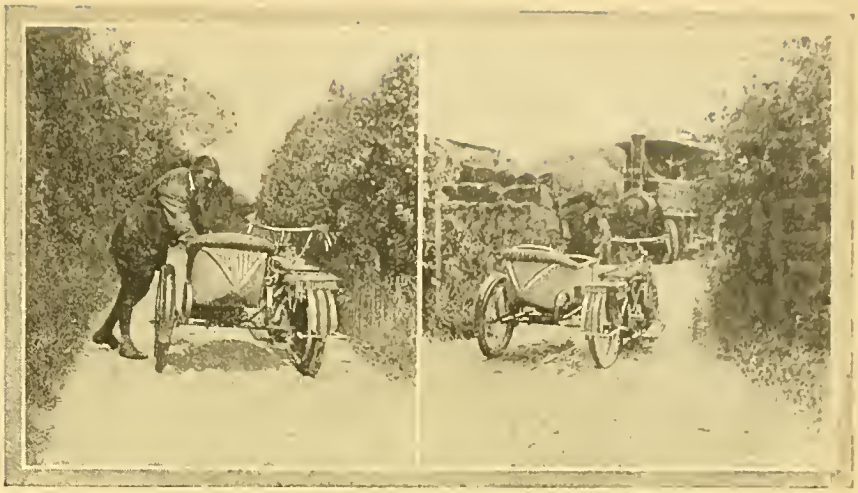
I own a 1912 2¾ h.p. twin. I notice a great deal of misfiring in the front cylinder, while the back cylinder fires very evenly indeed. Every now and then both of them are quite all right, but on the whole the front one misfires much more than it ought to. Will you please tell me the cause of this?—R.N.

There are several causes of the trouble you are experiencing, the most likely being a faulty plug, or one where the points are adjusted either too closely or too wide apart. The gap should be about $\frac{1}{32}$in. The carbon brush for the front cylinder may be damaged or dirty. See that the insulation of the high-tension wire is not damaged and so shorting to the frame. You should also make sure the valve springs are in good order and are not too weak. The contact breaker points should break evenly for both cylinders and should separate .4 mm.

Lubrication Devices.

Will you kindly explain the advantages and disadvantages of the various kinds of drip feed lubricators for motor cycles? First, those operated by suction from the vacuum in the crank case; second, those actuated by a spring? Am I correct in assuming that the former (No. 1) give a supply to the engine automatically greater or less according to whether the engine is running fast or slow? If so, where is the need of the second class of lubricators actuated with a spring? Is the vacuum in the crank case liable to fail from any cause? If then the No. 1 class of lubricator gives the engine its oil automatically according to speed, what more is required, and where is the need of applying a spring which, instead of supplying the engine with oil according to its speed, supplies it according to time, which appears to me to be incorrect? Or, in case of the spring lubricators, is there not also, as in the case of the No. 1 lubricators, a suction going on in the crank case to increase the supply in those also when the piston is moving more rapidly; that is to say, do not the No. 2 lubricators work partially by spring and partially by suction?—E.J.H.

No; the automatic drip feed lubricator No. 1 does not vary the amount of oil supplied to the engine according to the increased speed. The partial vacuum in the crank case which sucks the oil from the tank through the sight feed alters so very slightly with the variation of speed that it would not affect the quantity of oil drawn through. The quantity is practically entirely regulated by the needle valve. This also applies to the type operated by the pump and spring, but in this case the flow also varies according to the position of the plunger, viz., when it is first depressed the compression on the spring is greater, therefore more oil is forced through. In the case of No. 1 the chief trouble arises from faulty crank case joints, but frequently from the ball valves becoming stuck, thus allowing air to enter the crank case and spoil the vacuum. The ideal lubrication system has yet to be designed for a motor cycle—one similar to that fitted to Daimler cars is what is wanted, viz., where the amount of oil is increased or decreased as the throttle is either opened or closed, so giving more oil to the cylinder and piston when the engine is working hard and less when running light.



COUNTRY LANE WANDERING ON A SIDECAR.

As a change from straightaway runs on main roads, nothing is more delightful than a ramble on the byways, and for such a trip a sidecar is, for obvious reasons, a very suitable vehicle. Our picture shows a 1915 3½ h.p. Premier sidecar outfit.

Misfiring on Rough Roads.

I should feel very much obliged if you would enlighten me on the following points concerning my 1911 3½ h.p. single-cylinder machine: (1.) When travelling at a fair pace, say 20 m.p.h., a misfire occasionally occurs, and it is specially noticeable when going over an object in the road, since, as soon as the machine receives a jolt it will misfire. The jet size is, I think, about 33 or 34. Petrol sometimes drips from the carburetter if the machine is tilted over slightly on one side. Everything is clean. The carburetter takes a good deal of air, but, however one adjusts the levers, this occasional misfiring occurs. Is the jet too large? The engine gets very hot. (2.) The saddle position being high, I thought of having the top tube dropped at the rear; that is, either curved at the rear, or brought straight down as in the A.J.S. Would this weaken the frame at all, and which would be the most preferable, the straight or curved tube? (3.) I can just touch 40 m.p.h. Is this a good speed for this machine, or ought I to get more, as the engine is in perfect condition?—G.L.

(1.) We should say that the trouble is probably due to the level of the petrol in the carburetter being slightly too high. Going over a bump would cause an excess of petrol, and, consequently, too strong a mixture and misfiring. Also make sure the high-tension wire is quite sound and is not shorting to the frame anywhere when jolted. (2.) You will find a tube curved at the rear or a straight dropped tube perfectly satisfactory. Neither will weaken the frame if the work is properly carried out by a competent repairer. (3.) You should get about 45 m.p.h.

EXPERIENCES WANTED.

Readers desirous of obtaining the experience of others with various motor cycles or accessories must enclose a stamped addressed envelope in which the replies may be forwarded. Answers to the queries should be addressed c/o The Editor.

"S.T.C." (Sussex).—2 h.p. Calthorpe two-speed. Consumption, maximum speed, hill-climbing, and reliability.

"E.A.H.M." (India).—G.N. cycle car and Morgan runabout in India. Effect of heat on engine.

"B.R.F." (Birmingham).—2¾ h.p. De Luxe T.D.C. two-stroke. Stability, lubrication, efficiency, and suitability for sidecar work. Also Grado multi pulley.

RECOMMENDED ROUTES.

ST. NEOTS TO RUISLIP.—MRS. V.S.

ROYAL ENFIELD

Whatever type of motor cycle you require there is a Royal Enfield model to suit—and in every one the famous Enfield Two-speed Gear, Cush Drive Hub, and Chain Transmission are embodied. Royal Enfields are reliable.

The illustration above shows the 6 h.p. Royal Enfield sidecar combination. There never has been a more satisfactory passenger model than this—it is the standard of quality and efficiency the world over.

Four great Allied Armies are all using Royal Enfields.

At 40 guineas
The 2¼ h.p. Royal Enfield Two-stroke Lightweight.

At 50 guineas
The 3 h.p. Royal Enfield.

At 85 guineas
The famous 6 h.p. Royal Enfield Sidecar Combination.

At 100 guineas
The 6 h.p. Sidecar Combination. Complete with Lucas Dynamo Lighting Set, etc.

Mention "The Motor Cycle" and write for the Royal Enfield Catalogue.

Useful and Economical Christmas Presents.

A suggestion that these well-known books would provide appropriate gifts for friends in the motor sections of the Army, or in training for these branches of the Service.

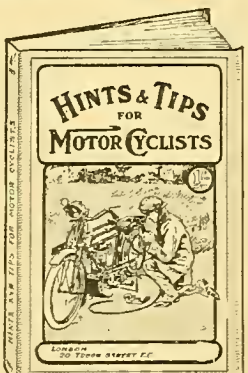
THE selection of Christmas gifts is always a matter of some difficulty, and the unusual conditions prevailing this year render it even more difficult. As a means of assisting our readers to choose appropriate presents for their motoring friends, particulars are given below of the various handbooks issued by the publishers of *The Motor Cycle*. These would no doubt be found suitable for presentation to motor cycling friends serving as despatch riders in the Army, in the Motor Machine Gun Section, or other branches of the Service. For friends in the Motor Transport the motoring handbooks mentioned would be most useful.

"MOTOR CYCLES & HOW TO MANAGE THEM."

Of all the books that have been published for motor cyclists this easily takes pride of place. It is recognised everywhere as the standard handbook on the motor cycle, its care and management, and the fact that it has now reached its sixteenth edition (revised) shows the exceptional degree of popularity it enjoys. The book, though comparatively small in size, is a veritable storehouse of useful information, compiled with care and discrimination for the benefit of all users of motor cycles. The present edition is a great improvement on the earlier ones, and it may be said with strict accuracy that it tells the motor cyclist everything he wants to know.

In this edition the chapters dealing with the carburetter, transmission, and gearing have been carefully revised and enlarged, and are a most important feature. The chapter on the two-stroke engine has also been enlarged, and practically every two-stroke engine on the market is now described. Gas and electric lighting, including rear lighting, are dealt with very fully. There are numerous illustrations, and a very comprehensive index is included to facilitate reference to any particular subject. The price of the book is 1s. net, by post 1s. 4d.

"HINTS & TIPS FOR MOTOR CYCLISTS."



This book gives hundreds of useful "wrinkles" and little items of information concerning the running, management, and repair of motor cycles, and contains what may be termed the cream of up-to-date motor cycling knowledge. The large mass of knowledge which is more or less common to all experienced riders has been collected in the course of years and "boiled down" in this book for the benefit of riders of lesser experience. By a careful system of paragraphing and indexing all this knowledge is presented in a most convenient form. Every part of the machine and every aspect of its use is fully covered. Each item of information is reliable, being the result of practical experience on the road. Here, again, two-stroke machines are given their meed of space, so, no matter what type of machine is used, the book will prove equally valuable. Although nearly 1,000 hints and tips are given, the size of the book is only 6in. × 4in., and it occupies, therefore, very little space in the pocket or valise—an important consideration to the military motor cyclist with full equipment. Price 1s. net, by post 1s. 2d.

"TRACING TROUBLES."

Nothing in this world is free from trouble, not even the almost perfect modern motor cycle. Faults of various kinds will develop occasionally, and these are often a source of worry to the rider, even if he has had considerable experience. This book has been written to put an end to such worry, by enabling the rider, not only quickly to trace the cause of the fault, but to remedy the fault in the shortest possible time. The work is ingeniously arranged, so that it can be used with equal facility whether the rider knows exactly what is wrong with his machine, or whether he does not know what is the matter. The system of identifying and remedying faults is applicable to all makes of machines, both four-stroke and two-stroke. A special section is also included, dealing with dynamo lighting sets for motor cyclists, and in all other respects the book is fully up to date. The price is 1s. net, or 1s. 2d. if ordered by post.

"THE AUTOCAR HANDBOOK."

A practical guide to the motor car—its care, management, and equipment. Thoroughly up-to-date in matters relating to electric starting, car lighting dynamos, carburetters, lubrication, etc. Price 1s. 6d. net. By post 1s. 11d.

"COMPLETE HINTS & TIPS FOR AUTOMOBILISTS."

A selection of the most useful "Hints and Tips" that have appeared in *The Autocar*. New and revised edition now ready. Price 2s. 6d. net. By post 2s. 11d.

"THE MAINTENANCE & REPAIR OF MOTOR CARS."

Written specially for the man who looks after the car, and dealing entirely with the upkeep of the car, including minor repairs. Price 2s. 6d. net. By post 2s. 9d.

"ELECTRICITY AND THE MOTOR CAR."

Dealing with electric car lighting, electric engine starting, and electric ignition, with simple explanations of various appliances. Well illustrated. Price 1s. 6d. net. By post 1s. 9d.

"FAULTS AND HOW TO FIND THEM."

A system of locating faults in motor cars, with a remedy for each fault. New edition (fully revised) now ready. Price 2s. 6d. net. By post 2s. 9d.

"THE AUTOCAR DICTIONARY."

Giving twelve thousand technical terms and other words used in connection with motors and motoring, in English, French and German. Price 3s. 6d. net. By post 3s. 9d.

Any of the above books can be obtained direct from the publishers—Iliffe & Sons Ltd., 20, Tudor Street, London, E.C. A remittance should in all cases accompany the order. If required, the books ordered will be sent direct by the publishers to a friend on receipt of the address or a prepared label.

MISCELLANEOUS ADVERTISEMENTS.

PRICES.

ADVERTISEMENTS in these columns —First 12 words or less 1/6, and 3d. for every two words after. Each paragraph is charged separately. Name and address must be counted. Series discounts and special terms to regular trade advertisers will be quoted on application.

Postal Orders sent in payment for advertisements should be made payable to ILIFFE & SONS Ltd., and crossed & Co.

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Hertford Street, Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," Coventry, or London (20, Tudor St., E.C.), by the first post on Friday morning previous to the day of issue.

All letters relating to advertisements should quote the number which is printed at the end of each advertisement, and the date of the issue in which it appeared.

The proprietors are not responsible for clerical or printers' errors, although every care is taken to avoid mistakes.

NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, the sum of 6d. to defray the cost of registration and to cover postage on replies must be added to the advertisement charge. Only the number will appear in the advertisement. Replies should be addressed, "No. 000, c/o 'The Motor Cycle,' Coventry"; or if "London" is added to the address, then to the number given, c/o "The Motor Cycle," 20, Tudor Street, E.C.

DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt.

The time allowed for a decision after receipt of the goods is three days, and if a sale is effected we remit the amount to the seller, but if not we return the amount to the depositor, and each party to the transaction pays carriage one way. For all transactions exceeding £10 in value, a deposit fee of 2s. 6d. is charged, when under £10 the fee is 1s. All deposit matters are dealt with at Coventry, and cheques and money orders should be made payable to Iliffe & Sons Limited.

The letter "D" at the end of an advertisement is an indication that the advertiser is willing to avail himself of the Deposit System. Other advertisers may be equally desirous, but have not advised us to that effect.

SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

DEFENCE OF THE REALM ACT

Under the provisions of the above Act, advertisers requiring workmen, and whose business consists wholly or mainly of engineering or the productions of munitions of war, or substances required for the production thereof, and whose works are situated within 30 miles of London, must include in every such advertisement the words, "No person resident more than 10 miles away, or already engaged on Government work, will be engaged."

Advertisers whose works are situated more than 30 miles from London can only have their announcements inserted with the approval of the Board of Trade, who will allocate to each advertisement a box number, and collect and distribute to the advertiser all replies received. The necessary forms of application can be obtained from any Labour Exchange or from the offices of this paper, and each advertisement must contain a clear reference to the effect that no person already engaged on Government work need apply.

The DRUID MARK II., For Solo or Sidecar. Made in three models.

A sure Guide

to the satisfactory selection of the Motor Cycle is to see that the Forks fitted bear the well-known DRUID name —

A guarantee of comfortable riding — a certain means of ensuring the longest possible life of the machine.

The DRUID MARK II.

with Vertical and Horizontal Action

as illustrated above, is easily the most efficient Spring Fork ever designed, and is different and superior to any other make, being the ONLY Fork which totally absorbs WITHIN ITSELF every kind of shock to which the machine is liable, hence —

when buying, INSIST upon the DRUID!

Fullest details gladly sent upon request to the makers —

A. DREW & Co., Ld.

The "IVY" Two Stroke

Programme for 1916

The IVY—during the year 1915 has maintained its splendid reputation, and we are assured by letters from our clients that the little machines are giving every satisfaction. We take this opportunity of thanking those past and present riders of the IVY Two-stroke, whose kind patronage has enabled us to put before the public the aristocrat of its type, and to assure potential purchasers that for 1916, although only improved in detail, it is better than ever.

We are retaining all the models which have been such a success last season, viz.:—Tourist, De Luxe, and Lady's two-strokes, with or without 2-speed gears, and are introducing one new model—a 3 h.p. two-stroke (70 x 90) single-cylinder, which will be sold as a solo machine, and with a sidecar as a lightweight combination. This latter, however, will not be ready for delivery before February, 1916.

Tourist Model Fixed engine **£29 10**
2¼ h.p. (64x70)
Solo Machine. 2-speed **£36 0**

De Luxe Model Fixed engine **£34 0**
2¼ h.p. (64x70)
Solo Machine. 2-speed **£40 10**

Lady's Model Fixed engine **£31 0**
2¼ h.p. (64x70)
Solo Machine. 2-speed **£37 10**

3 h.p. single-cylinder two-stroke, 70 x 90 bore and stroke. Solo machine, and with sidecar as combination, with or without 2-speed gear. Prices not yet fixed; deliveries cannot be commenced before February, 1916.

What good would a Belt be without a Fastener?

It would be useless, of course, and it is just about the same fitting a cheap fastener, which will wear out quickly, jump apart in use, and probably break at a critical moment.

COLLIERS MOTORIES

DEAL STREET
(near Station), HALIFAX.

IGNITION APPLIANCES.

MAGNETO Repairs.—The London and Paris Magneto Co., 154, Gt. Portland St., London.—Lowest prices compatible with good work. Avoid tinkering and excessive manufacturers' charges. Magnetos bought and sold.—'Phone: Gerrard 1908. [5086

MAGNETO Repairs of every description by Bosch specialists. Expedition and moderate charges. Magnetos bought and sold. Every repair carries a twelvemonth guarantee. 1 and 2-cyl. magnetos in stock.—The Magneto Mart and Repairing Co., 142, Wardour St., W. 'Phone: Gerrard 727. [7307

MAGNETO Repairs of Every Description.—We are late from the Bosch Works, and entirely British, and give same guarantee at half their prices in 24 hours. We hold a large stock of spare parts.—The Magneto Repairing and Winding Co., 158, Seymour St., Euston, London. 'Phone: Museum 1158. [7313

TYRES.

LEGGATE'S, Edinburgh, for Tyre Value.

LEGGATE'S, Edinburgh.—For great reductions in brand new clearance tyres. See below for approval terms. Prompt despatch guaranteed.

LEGGATE'S, Edinburgh.—Clearance.—1915 new pattern Clincher Dreadnought, 6-ply fabric, extra heavy, rubber studded, beaded covers, 26×2¼ 31/- list £2/7/3; 26×2½, to fit 2¼ rims, 31/6, list £2/7/3; 26×2½ 32/6, list £2/10/10.

LEGGATE'S, Edinburgh.—Clearance.—1915 new pattern Clincher de luxe, heavy rubber studded, beaded covers: 26×2, 21/-; 26×2¼, 21/-; 26×2⅜, to fit 2¼ rims, 25/6; 26×2½, 25/6.

LEGGATE'S, Edinburgh. — Clearance. — 1915 new Clincher de Luxe, beaded edge, 4-ply fabric, special heavy, rubber studded, "added" non-skid pattern (not recessed) covers, 26×2½, for 2¼ rims, 27/6; special value; absolutely "it" for greasy roads.

LEGGATE'S, Edinburgh.—Standard 1915 Clincher Dreadnought, 3-ribbed, 6-ply fabric, beaded covers, 650×65 39/9, 700×80 44/9, 700×80 for 650×65 rims 44/9; specially made for voiturette rims of extra powerful passenger outfits and light cars.

LEGGATE'S, Edinburgh. — Clearance.—1915 Dunlop extra heavy rubber-studded beaded covers, 26×2⅛, 28/6, list 37/9; 28×2½ (for Indians), 31/-, list 41/3; 28/3 (for Indians or Harley-Davidsons), 33/-, list 44/-.

LEGGATE'S, Edinburgh.—1915 Dunlop tubes, best quality, extra heavy, fully guaranteed, 24×2 6/6, 24×2¼ 7/-, 26×1¾ 6/6, 26×2 6/9, 26×2¼ 7/9, 26×2⅛ 8/6, 26×2½ 8/9, 26×3 9/6, 650..65 10/6, 28×2½ 9/-, 28×3 10/6.

LEGGATE'S, Edinburgh.—These goods are all brand new, and sent anywhere on 7 days' approval against remittance; cash refunded in full if goods not approved of.

LEGGATE and Co., Motor Cycle Specialists, 15, Slateford Rd., Edinburgh. [X5491

ECONOMIC.—We hold written testimonials for over 10,000 miles for our 650×65 Pillion rubber-studded covers at 18/-.

ECONOMIC.—Avon clearance: 26×2 Stonehenge, Druid, and rubber-studded, 16/9; 26×2¼ Druid, Invicta, and rubber-studded, 17/6.

ECONOMIC.—Avon clearance: 26×2¼ tricar, 27/6, listed 38/6; 26×2½ 27/6, listed 41/3.

ECONOMIC.—Kempshalls, special for Douglas and 26×2 rims; 26×2¼ clearance anti-skids, deepened treads, 24/6. carriage paid.

ECONOMIC.—Kempshall clearance nonskids, 26×2¼ 35/-, 26×2⅜ 38/-, 46×2½ 40/-, 650×65 50/-, 28×3 55/-, carriage paid.

ECONOMIC.—Kempshall clearance anti-skids, 26×2¼ 24/6, 26×2⅜ 25/6, 26×2½ 27/-, carriage paid.

ECONOMIC.—Clinchers, special for Levis, 24×2 heavy 4-ply de luxe covers 19/6, tubes 5/6, complete tyre 24/-.

ECONOMIC.—Burnett Suction Cup, also rubber-studded patterns, 26×2¼ 15/6, were 17/6; 26×2½ 15/6, were 18/6; 26×3 22/6, were 25/-.

ECONOMIC.—Continental 4-ply heavy Model de Course, 26×2¼ 18/6, 26×2½ 18/-; special to clear.

ECONOMIC.—Kempshall 650×65, steel studs in fibre, fully guaranteed, 55/-; 24×2 Michelin steel stud, 21/-; carriage paid.

ECONOMIC.—Continental Model de Course, 26×2⅛, 2¼, oversize for 26×2¼, 25/-, carriage paid, brand new.

ECONOMIC.—Continental 26×2¼ wired 10/6, 26×2¼ steel stud combination 36/- (listed 50/-).

ECONOMIC.—Continental basket pattern, 24×2 15/6, 26×2 16/9, 26×2¼ 19/6, 26×2⅜ 20/-.

ECONOMIC.—Clincher ⅞in. section in 7ft. lengths, 11d.; two-piece belts cut to any requirements.

ECONOMIC.—Continental beltiug, ¾in. 11d., 1in. 1/3; Shamrock-Gloria, ⅞in. 1/-, 1in. 1/2; Avon, ⅝in. 10d.; fasteners free all belts.

ECONOMIC Tyre Co., 137, Lewisham High Rd., New Cross. 'Phone: New Cross 1393. Special clearance lines. Close 1 Thursday, 8.30 Saturdays. [7219

The Influence of Aero Engines on Motor Cycle Design.

AS there are several points in common between aero engines and those used on motor cycles, we make no apology for introducing a feature which some, at a first glance, might consider to be outside our province. A little thought will, however, show that, although an aero engine is a much more ambitious affair, the *desiderata* are very much the same in each case. Light weight is, perhaps, the first point which will occur to the reader, and here what is an absolute necessity for aeroplane work is also very desirable in the case of a motor cycle, for a light engine means also a light frame, with its consequent ease of handling and economy of tyres and petrol.

This brings us to a second desirable point, viz., economy. On a motor cycle the tank capacity is limited, and possibly the rider's purse is limited too, therefore an economical and efficient engine is a *sine quâ non*. In aeroplane practice it is most undesirable that frequent descents should be made for the purpose of obtaining fuel; also it is essential that the initial weight of the fuel should be kept as low as possible.

Engine efficiency is another point which is bound up with the two already mentioned; we allude to power in comparison with cubic capacity as well as power for fuel consumed. This, again, is of equal importance to both sports (if such a word can at present be applied to airmanship). Evenness of torque, an absolute essential on an aeroplane if vibration of the propeller is to be avoided, is also "a consummation devoutly to be wished" on the humbler mount. Here again an economy in tyres and transmission would result, and frames could be made lighter.

On the other hand, there are also many points of difference. The engine frame can be made much lighter for work in the air, and the crank case is not expected to supply part of the main frame. (This is a method of construction with which many motor cycle designers are not in agreement.) Road vibration has not to be considered, and an aeroplane engine, although it may have to work all the time at high pressure, while a motor cycle engine is only called upon to exert its full power at intervals, is yet running under ideal conditions, far removed from dust and dirt; it can, too, have a free exhaust, while a motor cycle engine must be silenced.

At the present time motor cycle designers are, as it were, "resting upon their oars" and improving details only, but the aeroplane world is more active than ever before. Thus it is quite likely that innovations now introduced in the latter sphere may reflect beneficially upon the former in the near future.

A Failing of Sidecar Stands.

ONE of those minor points which are often overlooked in the design of a machine, but which, nevertheless, cause a great deal more inconvenience than one would imagine, is the type of stand which is made to do duty on machines which are intended for sidecar work. With motor bicycles, of course, the legs of the stand must be of equal length, so that the machine stands upright. It is apparently overlooked that when a sidecar is attached, and it is desired to support the bicycle by the aid of its stand, only one leg is brought into operation by reason of the bicycle being pulled out of perpendicular. This quickly strains the stand, and, moreover, loosens the parts, so causing rattle. We have never seen this simple fact dwelt upon in print before, and we are reminded of the shortcomings of the modern stand in use with sidecars in a letter from a very smart mechanic in No. 1—the original—Motor Machine Gun Battery. Is it not time that manufacturers either produced a stand which will support the entire rear portion of a sidecar machine, or, if the present type be adhered to, then a stand with legs of unequal length in order to distribute the strain more evenly?

An Index to the advertisements in this issue will be found on the page facing the back cover

A Dutch-built Motor Cycle.

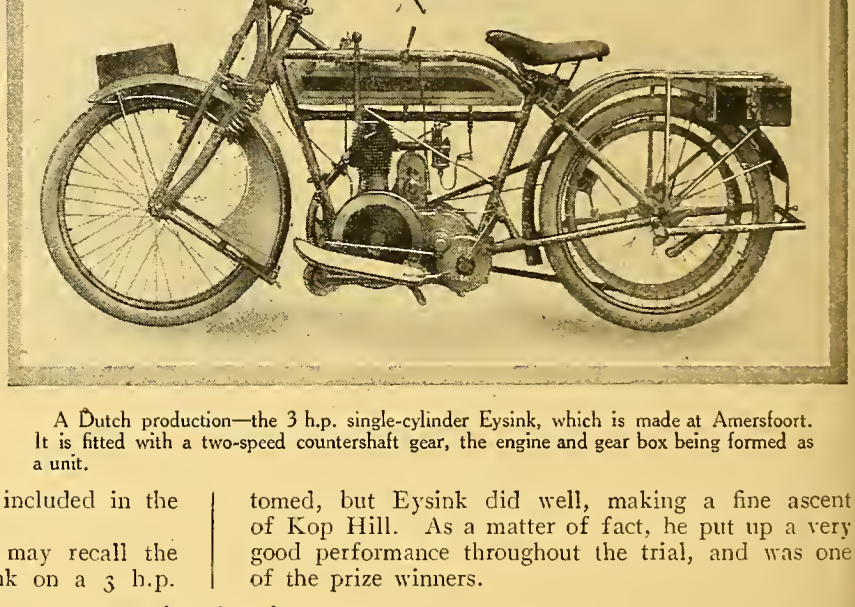
Little Change in Eysinks for 1916.

THE Eysink is not unknown to our readers as a soundly built machine, hailing from Amersfoort, Holland. The 1916 models are little altered from those of 1915, and the illustration that accompanies this letterpress is a typical example of one of the latest machines. It is a single-cylinder model, the engine dimensions being 74 mm. × 85 mm. (365 c.c.), and is rated at 3 h.p. A two-speed countershaft gear is fitted, and drive is by chain and belt, the chain being enclosed. Both engine and gears are manufactured in the Eysink works—a remark that applies to all models.

Another typical Eysink model is the large twin-cylinder 816 c.c. machine. The cylinder dimensions are 74 mm. × 95 mm., and three speeds in conjunction with an all-chain drive are standard.

Two other single-cylinder models complete the list. These are the 2½ h.p. (68 mm. × 85 mm. = 309 c.c.) and the 3½ h.p. (74 mm. × 95 mm. = 408 c.c.) Amac carburetters and other British fittings are included in the specification of all models.

As regards road performance, we may recall the splendid showing made by A. Eysink on a 3 h.p. machine of his make in the Anglo-Dutch trial of 1913. The Dutch riders in this trial did not shine on hills, which was not surprising in view of the flat nature of the roads to which they are accustomed, but Eysink did well, making a fine ascent of Kop Hill. As a matter of fact, he put up a very good performance throughout the trial, and was one of the prize winners.

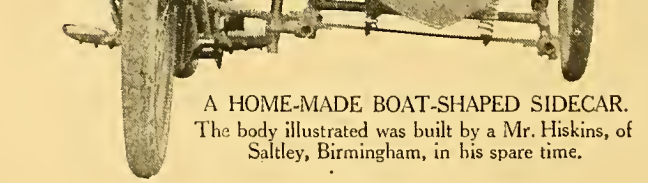


A Dutch production—the 3 h.p. single-cylinder Eysink, which is made at Amersfoort. It is fitted with a two-speed countershaft gear, the engine and gear box being formed as a unit.

A Jump in British Exports.

THE November Board of Trade returns show a very gratifying increase in the amount of British exports in respect of motor cycles. Compared with the corresponding month of 1913 and 1914, last month's figures are appreciably larger, and incidentally expose the fact that a great many more machines are finding their way abroad than the average man supposes. British exports are most necessary in view of the enormous quantity of imports—particularly munitions—against which it is necessary to keep up a balance of trade. Whereas in November, 1913—a peace-time month be it noted—we exported 1,427 machines, and in November, 1914, 1,374, last month's exports totalled 1,690 motor cycles. Including tyres and parts, the respective values were £87,549, £95,233, and £124,543. A good deal of the jump can be ascribed to the fact that Army requirements in respect of motor cycles have been cut down during the last month or two. We have known, too, the wise decision of a number of leading manufacturers to cultivate their Overseas market in preference to distributing the whole of their output in this country. In this connection the export figures relating to British South Africa are of interest, the value of the machines exported to the Union for the months of November in the years 1913, 1914, and 1915 being £19,884, £6,117, and £7,295 respectively.

Imports, too, show an increase, but do not in any way compare with the volume of British exports. The November returns for 1913, 1914, and 1915 show that 61, 12, and 105 motor cycles respectively were imported. With tyres and parts (the value of which exceeds the value of complete machines), the import figures for November were £27,916 in 1913, £2,103 in 1914, and £17,754 in 1915.



A HOME-MADE BOAT-SHAPED SIDECAR.
The body illustrated was built by a Mr. Hiskins, of Saltley, Birmingham, in his spare time.

Safeguarding Tank Stoppers.

There is nothing new under the sun. In our issue of December 2nd, Lieut. Rowlandson described how despatch riders at the Front avoid the loss of their tank stoppers by soldering to them a short piece of Bowden wire. Five years ago I lost three or four tank stoppers in a month from a machine afflicted with a very rigid frame and an ill-balanced engine. I purchased a spare stopper at a small agency in Yorkshire, and the agent showed me his own machine. He had employed the method which Lieut. Rowlandson suggests, but used a leather shoelace instead of Bowden wire. I tried the dodge for the rest of that season and found it also cured petrol spraying from the tank vent.

"Snatching."

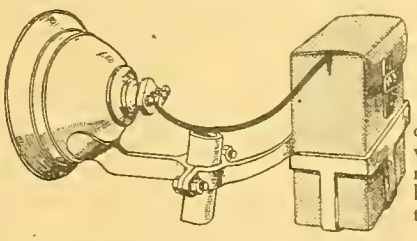
As I have been riding twins and two-strokes almost without intermission since the outbreak of war, I found myself in an unusually impartial frame of mind for testing a big single-cylinder with two-step drive when one came into my hands last week. It is no exaggeration to say I was appalled by the snatchiness of the drive when the engine was running slowly on any gear. Of course, I was well aware that we had sacrificed the delicious elasticity—or, as one would term it in wet weather, accursed slipperiness—of the belt when we began to coquet with chain-cum-belt and all-chain drives; but a prolonged period on twins and two-strokes had allowed me to forget how rough and harsh the average two-step drive really is with a big single-cylinder engine in front of it. I soon accommodated myself to the conditions, and formed the habit of keeping the engine "revving," *i.e.*, I was in much less of a hurry than usual to change up after starting, and in a much greater hurry to change down when a hill hove in sight. These strictures do not apply to all machines. For example, one famous chain-driver has such efficient cushioners included in its transmission that it pulls very smoothly when it is throttled down, though it certainly does not approach the silkiness of a first-grade horizontal twin. In fact, this particular machine (and possibly others of which I have no personal experience) is really less snatchy than the average chain-cum-belt single, because it has cushioning devices, and the belt is falsely regarded as a sufficient cushion in the alternative design. The limit in snatching is experienced when a two-stroke with two-step drive is four-stroking at low speeds, or when a four-stroke twin engine is firing on one cylinder only.

Two Alternatives?

I wonder which way the pendulum will swing on this point. Will this tendency to snatch ultimately kill the big single-cylinder now that two-step drives are practically universal? Or will the single-cylinder survive, being toned down by the inclusion of cushioned hubs or spring pulleys? The superiority of the twin, and especially of the horizontal twin, is so marked that one is tempted at first sight to prophesy the early disappearance of the single. On the other hand, the job of re-tuning the 500 c.c. single is infinitely simpler than that of re-tuning a 500 c.c. twin, be it a V or a horizontal; and it is not easy to see how the horizontal twin can ever be so mounted that its accessibility can compare with that of a first-class single. I fancy our stanch single-cylinders will play their part in future developments; but the rougher makes stand in crying need of a smoother transmission, and run heavy risks of losing their customers when the war is over and the public discovers how harsh some modern drives can be. If the 250-350 c.c. horizontal twins go on improving their efficiency at the present rate, they may ultimately rank as the most popular all-purpose mount of the future.

The Life of Dry Batteries.

I commented recently on the respective merits of various lighting systems, and a member of the trade considers that I over-emphasised the maintenance costs of a dry battery set. His remarks are naturally partisan, but I quote them on the chance that some more experienced user may be able to confirm them. He asserts that a first-class dry battery, costing about 8s. 6d. under the present war conditions, should light satisfactory head and tail lamps for from 80 to 100 hours in intermittent use. It would not, of course, last so long on a straightaway consumption, for it is a charcteristic of dry batteries that they recover during brief periods of disuse. If the lamps are used, say,



DRY BATTERY ELECTRIC LIGHTING.

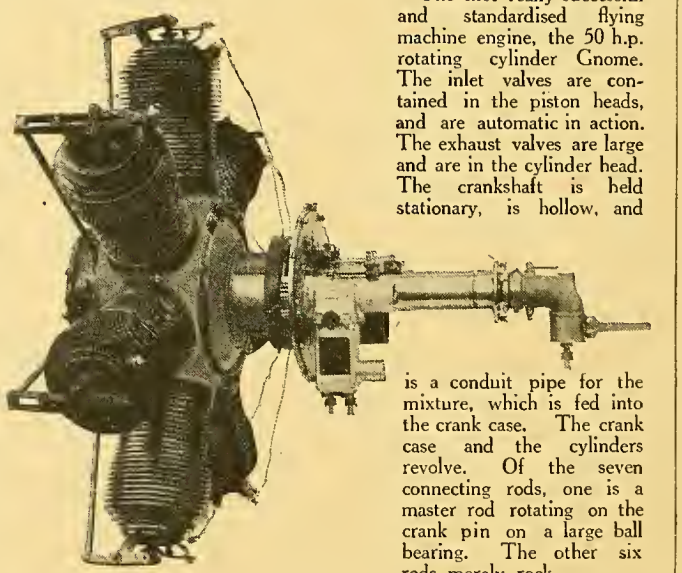
A neat method of carrying a dry battery which should recommend itself to riders having many short trips to make.

for four hours per week, and the four hours are distributed over two or three evenings, the single 8s. 6d. battery should last from four to six months, *i.e.*, through the best part of the winter; and the running cost will be about 1d. or 1¼d. per hour for the pair of lamps. In peace time, when the batteries cost but 6s., the maintenance was plainly cheaper. The usual mistake consists in using the wrong kind of bulb; a bulb which takes from a half to one ampère is obviously wasteful, when the battery dealers can supply special high efficiency, low consumption bulbs, taking no more than .3 ampère. It is, of course, a further extravagance to use current at this rate, and dim the lamp by painting the glass, or slipping a "tulip" dimmer over the bulb.

THE AERO ENGINE:

HOW WAR-TIME DEVELOPMENTS MAY HELP MOTOR CYCLE DESIGN.

STANDARD practice in construction must not be regarded as a fetish, but, on the other hand, to depart from the usual in design just for the sake of being original is equally a mistake, since it must not be forgotten that standard practice generally has been arrived at from bitter experience. In order, therefore, to approach more closely to one's ideals, or rather to a better compromise—since it is of engineering that we write—it is imperative to tap all sources of knowledge that are available. What is common knowledge in one branch of engineering frequently is almost unknown to another closely allied industry, and therefore a close acquaintance with the standard practice of similar branches of engineering, as, for instance, the construction of the automobile, the aeroplane, the motor lorry, the motor boat, and the motor cycle, may lead to the avoidance of mistakes, besides producing in the mind a better balance as regards the true worth of improvement. No other excuse, therefore, is necessary for the devotion of space in *The Motor Cycle* to the subject of the aeroplane engine. It is possible that the motor cyclist may borrow from the aeroplane as the motorist does to-day in discharge of the debt which the areoplane owes to the motor car.



The first really successful and standardised flying machine engine, the 50 h.p. rotating cylinder Gnome. The inlet valves are contained in the piston heads, and are automatic in action. The exhaust valves are large and are in the cylinder head. The crankshaft is held stationary, is hollow, and is a conduit pipe for the mixture, which is fed into the crank case. The crank case and the cylinders revolve. Of the seven connecting rods, one is a master rod rotating on the crank pin on a large ball bearing. The other six rods merely rock.

When the Wright Bros. turned their dream of flight into a reality they were only able to do so because of the existence of the petrol engine, which alone was capable of producing the necessary power under a great limitation of weight. Not that the four-cylinder engine employed by Wright Bros. was light, as petrol engines go, but the evolution of the motor car enabled them to produce something sufficiently light for their purpose. Directly flight became possible owing to the stage of development of the petrol engine a new field for the engine was at once opened up. The cry of the aeroplane designer has been, and continues to this day to be, for greater power and less weight. It is true that red herrings have been drawn across the scent which the aeroplane engine designer followed, but of recent years the fact has become patent to every student of the aeroplane that the power-for-weight problem is as pressing as ever.

The Importance of Speed.

Simply from the point of view of safety, without taking into account any military qualities, it must be obvious that the greater the speed range possessed by an aeroplane the safer it must be. By speed range one means the capacity of the same machine to fly slowly as well as fast. For instance, a good modern machine may be capable of flying in safety at 35 m.p.h., and obtaining a maximum speed of eighty or more miles an hour. The high speed means that the machine is less at the mercy of atmospheric disturbance, and the low speed means that it can be got off the ground or landed with far less danger of breakage and without a long run being necessary. The aeroplane engine must, therefore, be as light as possible in order that the complete aeroplane may not be over heavy per square foot of its supporting surface. It is of very little use, however, to produce a light engine unless it is also an efficient engine, using the term efficiency in its correct sense, that is, unless the engine can produce the maximum power for the minimum fuel consumption. The Gnome engine can be used as an illustration of this fact, and will be referred to later in this connection.

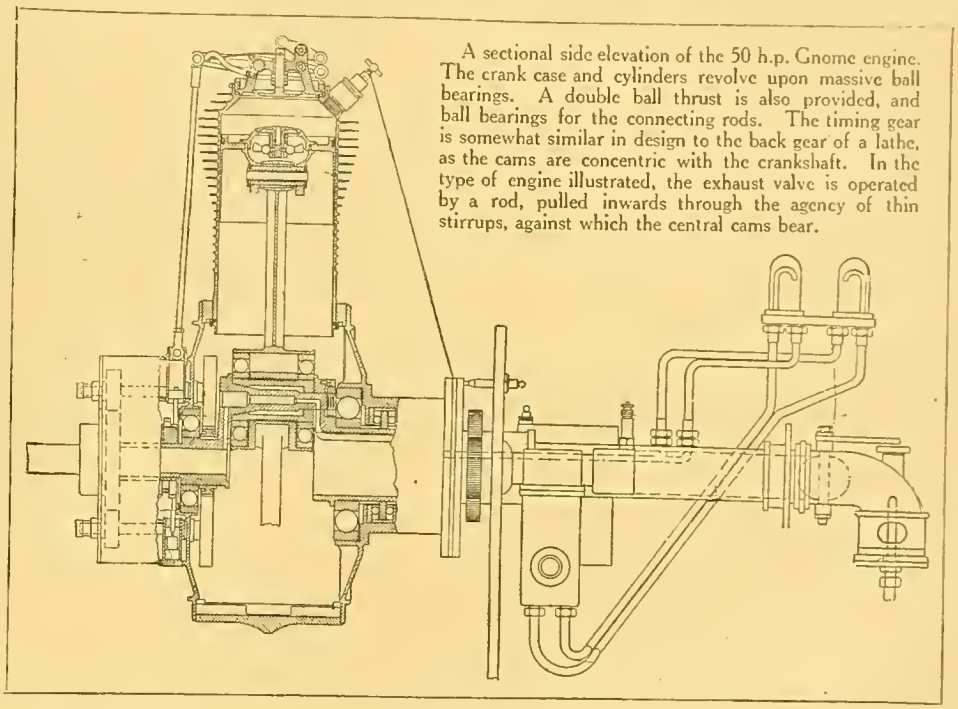
The Advantage of Light Weight.

The aeroplane and the motor cycle have one great feature in common—the lighter they can be made the better they will be. In the case of the aeroplane for the reasons given; and in the case of the motor cycle for the reasons that the heavy machine is more difficult to steer in grease, more tiring to handle, and more expensive to run than a light one. This, by the way, must not be taken to mean that we regard the lightweight motor cycle as being superior to the heavy touring variety. This does not by any means follow. A touring machine is well up to its work, and the lightweight machine is excellent for "to-ing

The Aero Engine.—

and fro-ing," but what one would like to see would be the lightweight machine with the power of the touring variety. There is also in favour of the lightweight machine its economy in fuel. This, it is true, is not a matter of saving any considerable amount of money, but, on the other hand, in these days particularly, the saving, however small, is worth effecting.

We have then arrived at a point that a constructional similarity between the aeroplane and the motor cycle does exist—both needs must be as light as possible. It is true that the parallel cannot be drawn too closely, because the motor cycle has to ride upon the road and is subjected to road vibration applied through two points, *i.e.*, the points of contact of the wheels with the road, whereas the aeroplane rides upon air and is subjected to extreme and violent buffeting rather than to vibration, this buffeting being applied to the machine as a whole rather than to any particular part of it. Again, the motor cycle by itself was originally intended to carry one person, or at the most two, whereas the aeroplane will extend from the single-seater machine up to a limit so far unguessable in the matter of size, since already there are machines capable of carrying ten or twelve passengers.



A sectional side elevation of the 50 h.p. Gnome engine. The crank case and cylinders revolve upon massive ball bearings. A double ball thrust is also provided, and ball bearings for the connecting rods. The timing gear is somewhat similar in design to the back gear of a lathe, as the cams are concentric with the crankshaft. In the type of engine illustrated, the exhaust valve is operated by a rod, pulled inwards through the agency of thin stirrups, against which the central cams bear.

Engine Attachments.

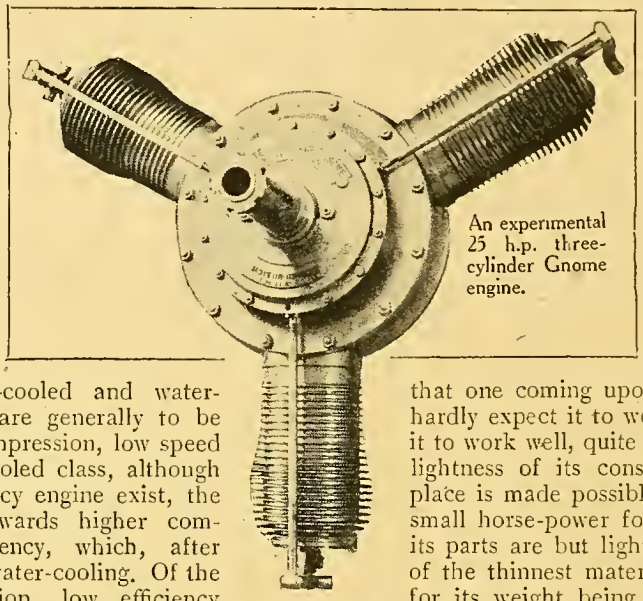
Before coming down to the individual design of aeroplane engine, perhaps a word or two concerning the way it is attached to the machine may be of interest. The lightness of the fastenings never fails to strike one as extraordinary. In the majority of cases the engine carrying arms, pressed steel plates, or wooden bearers, are built into a framework consisting of four ash longitudinals extending from the nose of the machine to the tail and forming the fuselage, these ash members being in the neighbourhood of 1¼in. square section and cross braced with steel wire. Upon this light framework will be found engines capable of developing anything from 100 to 150 h.p., and weighing, perhaps, 400 lb. To stand by one of these big engines going all out on the test bench driving a big propeller which creates a draught that one can lean against, it seems hard to credit that these few small pieces of ash are sufficient, yet in practice they are perfectly satisfactory. The reason, of course, is not far to seek. The work done by the engine is done against a medium of great elasticity, *i.e.*, the air. At least one would imagine it to be elastic when compared with the hard road, although as a matter of fact one would suppose that the tip of a propeller blade 8ft. 6in. in diameter, rotating at 1,200 r.p.m., having actually a speed approaching 350 miles an hour, finds the air anything but elastic. Since the work of the engine is smooth, therefore, one great difficulty in mounting is avoided. The problem is still further eased if the engine itself be designed to give an even torque and if the greatest care is devoted to its balance. That is why the tendency is all the time towards a multiplicity of cylinders, more cylinders being added as greater power is required, the size of the bore remaining much the same. The large number gives the even torque, and the comparatively small size means that the individual reaction of each cylinder is not heavy, and therefore a massive mounting is not necessary. The limit of size of the aeroplane engine cylinder seems at the present time to lie somewhere between 130 mm. to 150 mm. bore, more power being obtained by using more cylinders.

The Limitations of Price.

It may be advanced that it is all very well to bring up arguments in favour of the multi-cylinder engine for motor cycle work when the motor cycle lies under a commercial restriction from which the aeroplane does not suffer, that is, the restriction of price. So far as the aeroplane is concerned it is, of course, true that, within certain limits, price is of no consideration whatever at the present time. One must have the best material disposed in the best possible way irrespective of the cost. This fact may not hold good when the aeroplane becomes a commercial proposition, but at the present time it can hardly be said to be a commercial proposition. The public do not buy it, and it is sold only to Governments who buy it for war work, and for war work in these days price cannot be considered. However, it seems reasonable to suppose that if com-

The Aero Engine.—

mercial difficulties of manufacture could be overcome, the employment of the multi-cylinder engine for the motor cycle might assist in a general decrease of weight. How far this may be true is a matter for argument. It is hard to say at what point the small cylinder becomes too small to be practical, and also how light the framework of the machine may be made, seeing that the road shocks are probably more serious to the engine mounting than any vibration or torque of the engine is likely to be.



An experimental 25 h.p. three-cylinder Gnome engine.

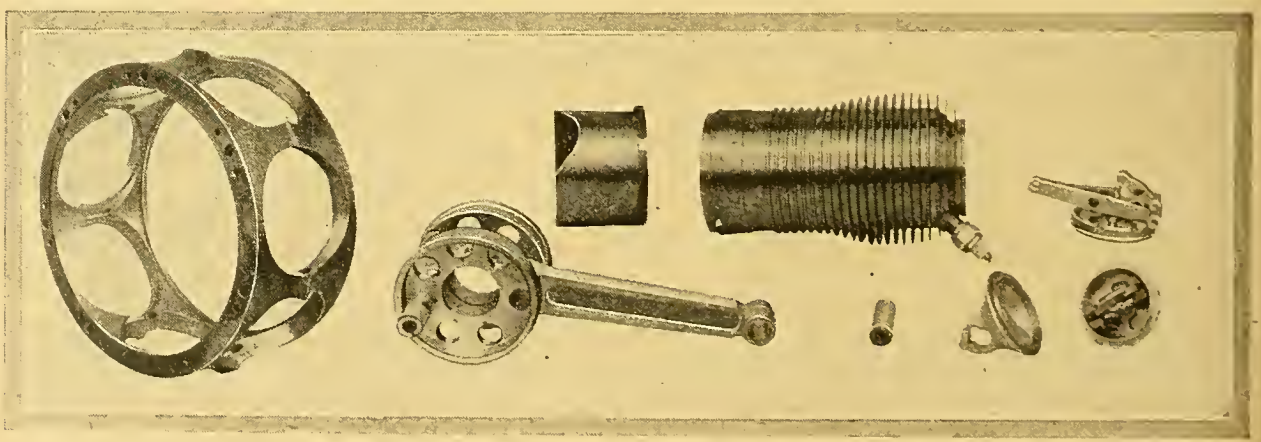
Air v. Water-cooling.

Aeroplane engines generally can be split up into two classes, *i.e.*, air-cooled and water-cooled. In the first class are generally to be found low efficiency, low compression, low speed designs, and in the water-cooled class, although examples of the low efficiency engine exist, the greater proportion tend towards higher compression and higher efficiency, which, after all, is made possible by the water-cooling. Of the slow speed, low compression, low efficiency engine, the Gnome is an excellent illustration. There is no doubt that the Gnome engine in the past has done more to make flying an accomplished everyday matter than any other individual engine. There are many reasons for this, the outstanding one being that the Gnome engine was, and still remains, the lightest design per brake horse-power ever produced. It should be noted that the words "per brake horse-power" are used, and not "per brake horse-power *per hour*," which implies a very different thing, and which is the real criterion of excellence.

It is well-known that the petrol consumption and castor oil consumption of the Gnome are very high, so that if the Gnome engine is required to fly a machine for more than three to four hours the total weight of the power plant becomes greater out of all proportion, so that it exceeds that of an initially heavier engine which has a higher efficiency and a better consumption.

From time to time one hears people say that the Gnome engine is dead as a modern aeroplane power plant, but the fact remains that until somebody can produce an engine of less initial weight, and having a better consumption, the Gnome will always be assured of a place as the engine for "stunt" flying purposes. Practically all the world's flying records have been won with Gnome engines initially. As a triumph of engineering skill it is hard to beat. The design of it is such that one coming upon it for the first time would hardly expect it to work, and certainly not expect it to work well, quite apart from the extraordinary lightness of its construction, which in the first place is made possible because it develops a very small horse-power for its capacity, and therefore its parts are but lightly stressed and can be built of the thinnest material. The strongest material for its weight being steel, the Gnome engine is built almost entirely of steel, parts being machined all over and very highly finished.

There is another reason besides that of its weight which has caused the Gnome engine to be regarded with great favour by designers of flying machines, and in explaining this reason it is possible also to explain how it is that the four-cylinder engine for flying machine work is extinct. The Gnome engine, by virtue of its excellent balance and extremely even torque, forms an excellent motor for turning round an air propeller. In the earlier days it was found that if the 50 h.p. Gnome engine was taken out of a standard type of machine, such as the original box kite Henry Farman, and a four-cylinder engine of actually greater brake horse-power put in, that the new engine did not possess the same power to fly the machine as



Some of the parts of the 50 h.p. Gnome engine. On the left is the crank case shell, next the master connecting rod with one of the subsidiary big end pins in place, next a gudgeon pin, and then the bracket in which the ends of the gudgeon pin are carried and which is screwed into the piston head. On the extreme right is an inlet valve which screws into the piston head from the top, whilst above can be seen one of the pistons with its single ring, next to it one of the thin steel cylinders and an exhaust valve.

The Aero Engine.—

did the Gnome (of which the effective horse-power is generally supposed to be about 38). The reason was that the more sharply defined impulses of the bigger four-cylinder engine caused vibration in the blades of the propeller to be set up, and this vibration seriously interfered with the efficiency of the latter. This phenomenon was generally referred to as propeller flutter, and even if the four-cylinder engine drove the propeller through the agency of a 2 to 1 reduction gear the results were still unfavourable to it, partly owing, perhaps, to the additional weight of the gearing. It is true that the four-cylinder engines used in the Wright machines, which drove twin propellers at comparatively slow speeds through the agency of chains, were fairly efficient, but, on the other hand, those same machines if equipped instead with a Gnome engine at once became very much better performers, leaving on one side, of course, all question of long distance flying. As almost everybody knows in these days, in the Gnome engine the cylinders and crank case revolve whilst the crankshaft is held stationary, a reversal of the usual procedure, which has the effect of giving an excellent balance whilst at the same time dispensing with the weight of the flywheel. This is of interest to the motor cycle designer, inasmuch as the flywheels on motor cycle engines represent a very large proportion of the total weight of the engine; also the machine on which the flywheel weight is cut down is by no means so comfortable to ride. However, it would hardly be possible to make a single cylinder rotating engine; conceivably the very minimum number of cylinders for a rotating engine is three, whilst, on the other hand, it is questionable whether the extra complication of three cylinders is worth while for a motor cycle, even supposing that the difficulties of silencing a rotating engine were overcome in a satisfactory manner. The Gnome Co. did, however, at one time build an experimental three-cylinder engine, of which we reproduce an illustration, but exactly what happened to it the company alone know. The fact that it never became well known may have been due merely to the fact that it was of too small a power to be sought after for aeroplane work, and of too high a price to be needed for any other purpose.

(To be continued.)

Varying the Power of Electric Light.

RIDING IN FOGGY WEATHER.

TWO letters have recently appeared in the correspondence columns which should be of considerable interest to those motor cyclists who have to ride at night. Both letters refer to lighting regulations at present in vogue. The first, from Mr. M. W. Goldstone, suggests the use of a 7½ volt bulb with a 4 volt accumulator or dry battery giving 4½ volts. This has a two-fold advantage: it reduces the light where necessary and economises current to a very considerable extent; but it has the disadvantage that the light cannot be varied from the saddle when one leaves the town where the lighting restrictions are in force, and finds oneself in the open country where a brighter light is necessary. The second letter, from Mr. H. E. H. Palairet, suggests a valuable bulb of ingenious construction, excellent in itself, but requiring structural alterations in the lamp, or bulb holder, even if such a bulb were on the market.

A Practical Suggestion.

Personally, I should advise any motor cyclist who is thinking of installing a cheap electric lighting outfit to purchase a 6 volt accumulator of fairly large size and good quality and wire it up to a two-way switch placed on the top tube in such a way that all three cells, or two only, could be made to supply current to the 6 volt bulb in the lamp. The wiring could be changed occasionally, so that the same cell would not always be cut out, and the "idle" cell could be made to light the rear lamp. In this manner 4 volts could be used in town and 6 volts in the country, the change could be made in a moment without dismounting, no apparatus is required which is not already on the market, there would be a saving in electricity, and no harm could be done to the bulb in switching on and off, as might be the case when switching on a fresh bulb—a bulb is said to be rather brittle at the moment of heating up—while in motion. A 6 volt lamp supplied with electricity by a 4 volt current will give but a moderate light, and the full voltage will be instantly available when wanted.

Winter Fog.

All electric lamps should be made capable of being focussed, partly because this enables the rider to obtain the kind of beam best suited to his purpose, partly because it gives him another method of complying with the aforesaid regulations, for a beam which illuminates objects at a distance of more than thirty yards (the limit in some districts) can be cut down and diffused, and partly because of its great convenience when riding in a fog. All riders know that a powerful and concentrated beam has the effect of so illuminating a thick fog that it looks like a white blanket, and nothing can be seen but the fog itself. It is often the case that the fog is lying very thickly upon the surface of the ground but has no great depth, and it is quite likely that the moon and stars may be visible. In such cases if the light be turned off it is at once apparent that the road can be seen, though indistinctly, for a moderate distance, but if the light be turned on again it at once vanishes in the lighted fog. When such conditions obtain it is advisable to throw the lamp out of focus by bringing the bulb nearer to the parabolic reflector. This has a double effect: it reduces the light upon the fog in front and enables something of the road to be seen—though perhaps not much—and it lights up the sides of the road to some extent, thus enabling a rider to locate his position with more ease and confidence. It is, I suppose, hardly necessary to point out that, under such conditions, it is as well to proceed with the utmost caution and at a slow speed.

It may interest readers to know that I have just had a Fuller Block accumulator purchased in September, 1914, charged for the *second* time.—AURIGA.

A Week in the West Country

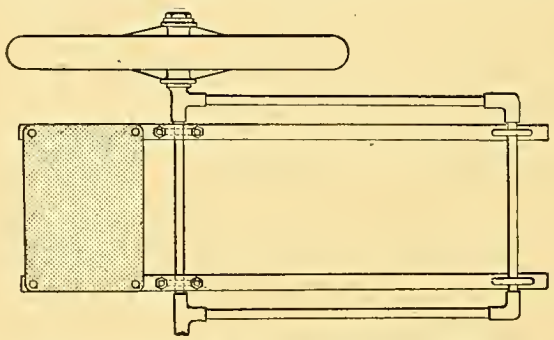
An Enjoyable & Economical Holiday on a 3½ h.p. Sidecar.

A FRIEND and myself in the late summer enjoyed a very pleasant and interesting trip in the West Country and on the South Coast. During the trip we carried our own food, only paying for suppers, beds, and breakfasts in hotels; this we found a considerable saving of time and expense.

We commenced our first day's run from the North of London and made our way through the lanes to Cranford Bridge, where we experienced our only trouble; this was caused by a 3in. nail penetrating the outer cover and punching several holes in the tube. To prevent delay we fitted a spare tube. From Cranford we made for Newbury and thence to Bath (109 miles), where we stopped for lunch. After leaving Bath we headed for Wells, Glastonbury, and Bridgwater, which ended our first day's run, a distance of about 150 miles. From London to Bridgwater we only had to use middle gear on two occasions, and only used the lower gear for starting purposes. Monday morning broke with it raining in torrents, which continued until after mid-day, so as this was a pleasure tour we postponed our start until afternoon, when it abated somewhat. We then made for the North Devon Coast and spent Monday evening at Minehead. We were now considerably behind our programme, our original intention being to reach Ilfracombe, but owing to the heavy rain and the Porlock-Lynton section being within a few miles we decided to go no further that night. The weather was again dull and threatening as we left Minehead for the 1912 Six Days terror, viz., Porlock. Just before entering Porlock there is a very bad left-hand hairpin bend downhill, with the road sloping away to the outside, which, when wet, is a positive death trap. We were told that two cars and a sidecar combination had been smashed here just before we arrived. This bend is the making of a lot of repair work for the motor repairer in Porlock village.

Now began the long climb up Porlock; to the first bend we used middle gear, changing down to low at the bend itself, and so continuing for the rest of the climb; the second bend is the worst part of the hill, but we suffered very little wheel slip, keeping up an even speed of about 8 to 10 m.p.h. It is wonderful how a 3½ h.p. engine pulling a heavy sidecar and passenger will run uphill for mile after mile on the lower gears without overheating! We continued over the top of Porlock to Countisbury without stopping, dropping down into Lynmouth very carefully, as Countisbury Hill was in a very wet and slippery condition.

The writer, F. J. Watson, and his companion, with the 3½ h.p. three-speed Ariel sidecar used on the trip.



How the author of the touring article reproduced on this page increased the luggage-carrying capacity of his sidecar. The small board platform was fixed to battens by four nuts and bolts. The battens were fitted over and under the chassis, so making the platform a tight fit, and only requiring four clips to keep it from moving.

Up Lynton Hill.

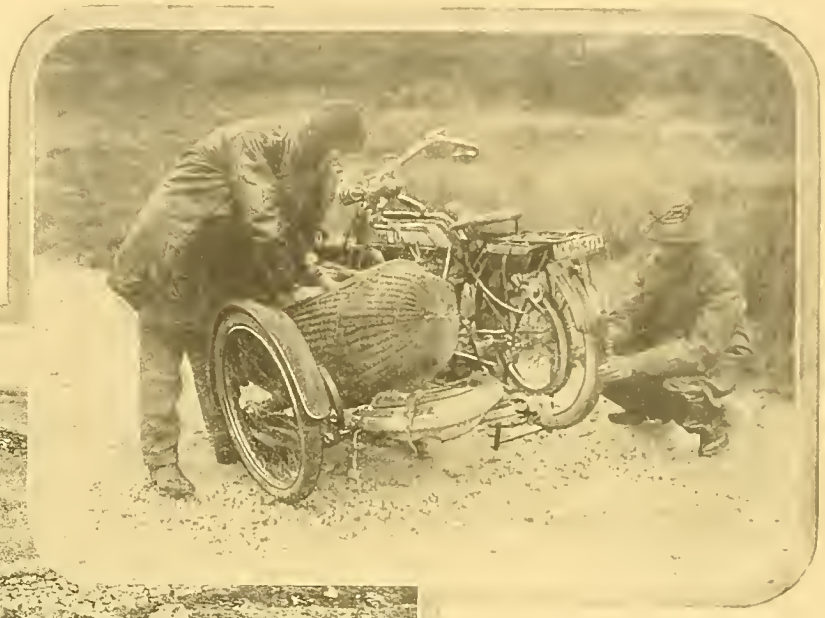
We stopped in Lynmouth whilst the passenger bought postcards, and while I was waiting for him at the foot of Lynton Hill an 8 h.p. twin and sidecar of late design fitted with a countershaft gear started up the hill with a roar, taking a flying start from the bridge. However, the driver did not succeed in his attempt; his speed seemed to be the cause of his failure, for his wheels refused to grip, and he came to a standstill about half-way up with the rear wheel tearing a hole in the road.

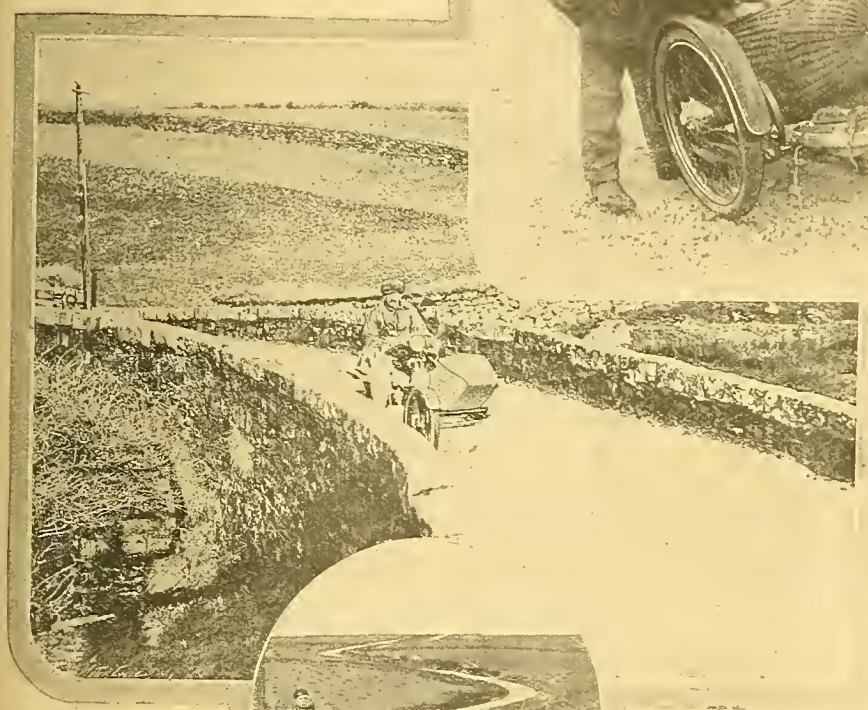
After this I was greatly pleased at being able to make a clean climb on the low gear with hardly a sign of wheel slip, although the engine had literally to lift the sidecar wheel through the ploughed up stones of which the hill is composed: a narrow strip on the off side is the only place where grip for the motor cycle wheels can be found. The drag of the sidecar was so great up this hill that the front wheel had to be held pointing over to the right to keep the machine straight, and more was taken off the front tyre than the rear; this is remarkable, but was easily noticeable at our next stop at Parracombe. I am sure the success of my 3½ h.p. passenger outfit was a great surprise to those on the hill, who ran up after us evidently expecting that we should want a push, but they were disappointed, as we went right up at an

A Week in the West Country.—

even speed; the hill was wet and in as bad a condition as I have ever seen it.

We then pursued our way *via* Parracombe, Ilfracombe, Barnstaple, Bideford, Holsworthy, Launceston, to Bodmin, where we stayed the night. On Wednesday morning we went through Probus and Truro, staying an hour to visit relatives, and then to Penzance, where we had lunch, and in the afternoon spent a very enjoyable time at the Land's End. Thursday was wet, so we amused ourselves as best we could in the town, and started the return journey on Friday morning, taking the M.C.C. course through Tavistock, over Dartmoor, *via* Two Bridges, Dartmeet Bridge, Holne Chase, Ashburton, and Exeter, then to Lyme Regis, which was our halt for the night. On Saturday our way lay through Bridport, Dorchester, Bere Regis, Bournemouth, Lyndhurst, and Southhampton; then *via* Botley to Poole, Havant, Chichester, and Arundel, where we stayed the night.





(Top) A roadside stop to mend a puncture.

(Left) Crossing over a bridge between Tavistock and Two Bridges.

(Below) A fine open road in Devonshire.

On Sunday, the last day of our trip, we rode into Brighton, and, after spending a few hours on the front, made for London *via* Cuckfield, Handcross, Reigate, and Wimbledon, which finished the run.

The distance covered during the eight days was, roughly, 730 miles, our average for a full day's run being 140 miles—as on the Monday, Wednesday, and Thursday, owing to the rain, we only did a small mileage. We had not the slightest trouble, with the exception of the cut tyre mentioned, and we had the satisfaction of covering a course which would cause the throttle of a big twin to be well opened. Single figure gradients abound on the stretch from Porlock to Ilfracombe, the most notable being Porlock and Lynton hills; there are also two steep hills at Parracombe. Countisbury was descended on this trip. The second trying piece of road is that between Tavistock and Ashburton with its long single figure climbs at Moorshop and from Merrivale Bridge. There is a sharp descent to Dartmeet Bridge, followed by an equally sharp and longer rise; beyond this place the worst hills were taken in the downward direction. We did not ride at any time after six o'clock in the evening, and our summary of daily runs is as follows:

	Miles.
Sunday (fine).—London to Bridgwater ...	150
Monday (wet).—Bridgwater to Minehead ...	30
Tuesday (dull).—Minehead to Bodmin	140
Wednesday.—Bodmin to Land's End and back to Penzance	60
Thursday (very wet).—No riding	0
Friday.—Penzance to Lyme Regis	150
Saturday.—Lyme Regis to Arundel	120
Sunday.—Arundel *via* Brighton to London ...	80
Total	730

I must say a good word for the 1915 Ariel 3½ h.p. combination, which never gave a moment's trouble during the entire run. F.J.W.

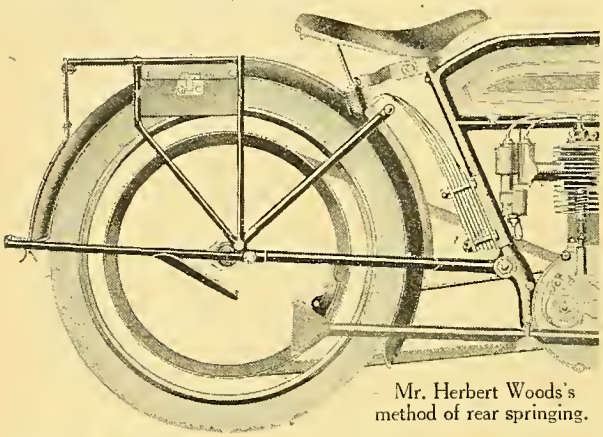
THE SPRING FRAME PROBLEM.

SOME FURTHER PROMISING ATTEMPTS AT ITS SOLUTION.

Designers, both amateur and professional, are still busily occupied with the spring frame campaign of "The Motor Cycle," and new ideas reach us almost daily. On this page we illustrate four of the more recent arrivals.

Simple and Sound Design.

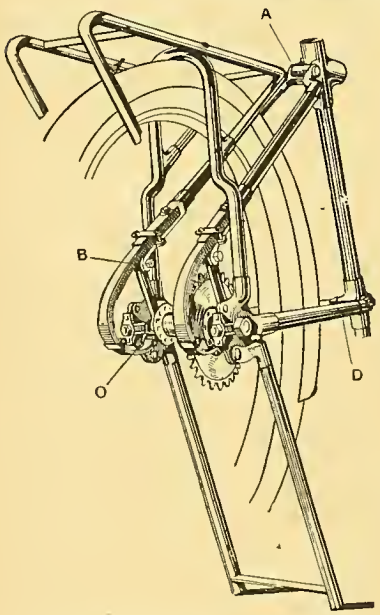
MR. HERBERT WOODS employs one leaf spring attached more or less vertically to the bottom of the saddle-pillar; the rear wheel is carried in a rigid rear frame composed of the usual two pairs of stays having a fixed connection at the axle end, while immediately outside the mudguard is placed a



Mr. Herbert Woods's method of rear springing.

curved down tube brazed to the bridge pieces, thereby ensuring absolute rigidity. This construction does not interfere with the removal of the rear wheel, and is excellent in the matter of lateral play or roll, while moving joints are reduced to a minimum.

A Flexible Rear Frame.

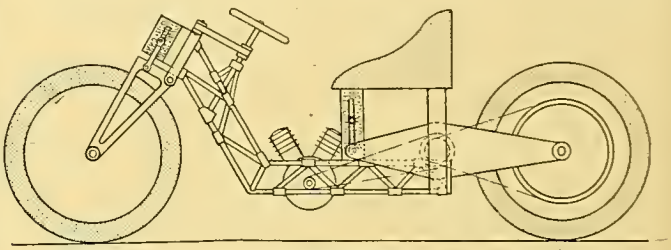


The Arlett spring frame. The lettering is referred to in the text.

IN the design sent by Mr. J. S. Arlett, the seat-pillar, chain stays, rear fork stays, and connecting link form a quadrilateral pivoted at all its four corners A B C D. Now if the back wheel meet an obstruction it will rise in relation to the saddle, and the angle A B C will be reduced. Springs are so placed that they tend to open the angle A B C. This system is novel, but contains rather a large number of joints, which should be avoided if possible. On the other hand, the lateral rigidity should be good.

An Original Design.

A VERY original design is that of Mr. W. R. Mackay. The rear wheel is carried in a separate frame which takes the form of a lever of the first order pivoted in the centre of the main frame. The front end of the lever is attached by links to a cross head controlled by spiral springs held in a casing under the seat. The springs are adjustable to any tension by screws which are not

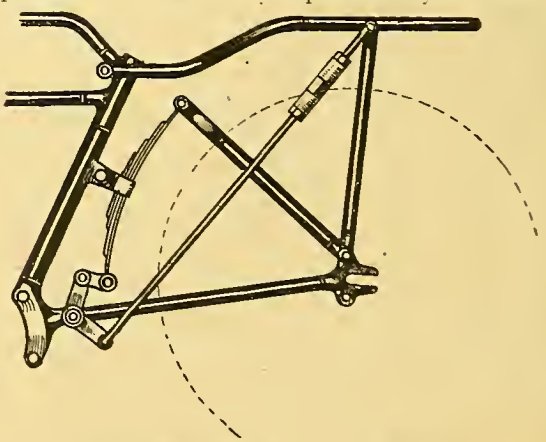


Novel design of motor cycle embodying a spring frame. The originator is Mr. W. R. Mackay.

shown in the sketch. Leaf springs can be employed, but adjustment is not so easy. The lever frame is made of sufficient width to clear a gear box, and the driving shaft is concentric with the pivots on which the frame swings. An inspection of the sketch will show that the whole machine possesses many novel features.

A Grasshopper Spring.

THE patent of Mr. G. F. Shimmin outlines quite a new and original method of rear springing. The leaf spring is mounted on a pivot midway between the saddle and the bottom bracket; the upper end is connected by a pair of stays to the rear



Spring frame patented by Mr. G. F. Shimmin.

wheel, while the lower end is similarly stressed by the weight of the machine and by obstacles met with on the road by means of diagonal stays and bell-crank levers. This system should give easy springing, but, as in many other designs, the carrier is unsprung and the pivots are somewhat numerous.

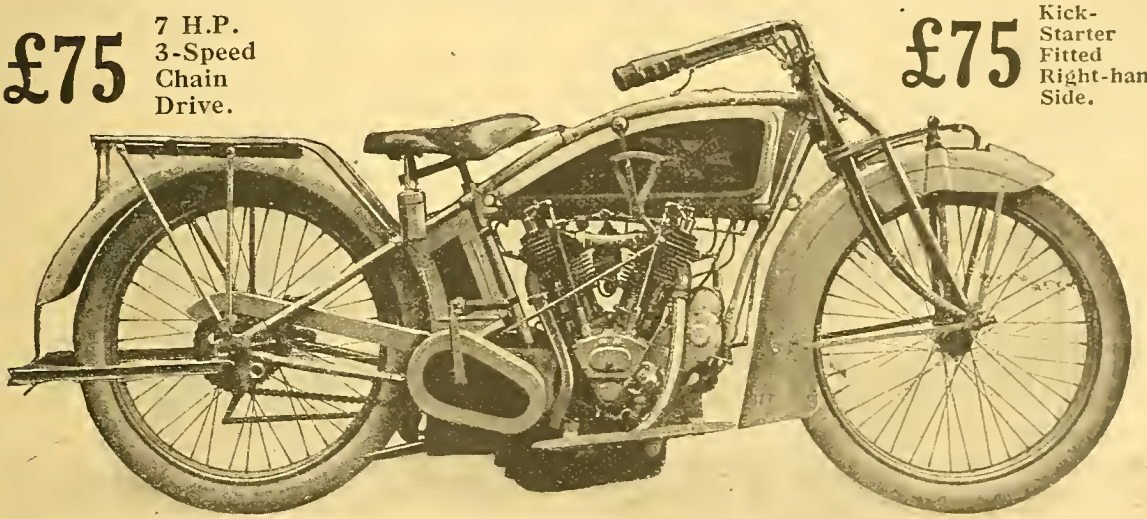
THE ARRIVAL OF THE 1916 MODEL

American EXCELSIOR

BETTER VALUE THAN EVER.

£75 7 H.P. 3-Speed Chain Drive.

£75 Kick-Starter Fitted Right-hand Side.



The most perfect motor cycle it is now possible to produce.

When a better motor cycle is built it will be an Excelsior.

The serene consciousness of personal safety, with absolute certainty of troubleless travel, is only one of the pleasures of riding an **X.**

IMMEDIATE DELIVERY.

Preliminary Specification from Sole Concessionnaires—

HARRIS & SONS, 10-12, Great Chapel Street, Oxford Street, LONDON, W.

Telephone—REGENT 3906.

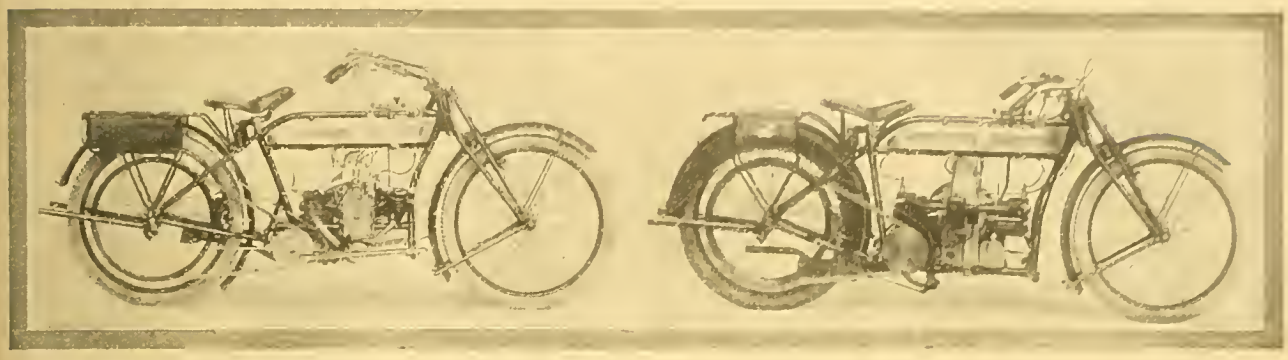
DOUGLASES FOR 1916.

Many Detail Improvements learnt from War Service Experiences.



(Left) The model W 2¾ h.p. Douglas, which is a full touring model, but without clutch or kick starter. (Right) The 4 h.p. Douglas, a machine intended for solo or passenger work.

THAT the war has resulted in the running of the finest and most valuable reliability trial in the world is amply proved by a careful study of the latest W.D. Douglas. Writing to us from the Front, an officer holding an important post at G.H.Q. is loud in his praises of this popular machine, though he does not hesitate to criticise when criticism is necessary. His remarks, with others, have been taken to heart by Messrs. Douglas Bros., with the result that the War Office model is as nearly as possible perfect for despatch riding.

Before dealing with the improvements *seriatim*, we will enumerate the models which will be on the market for the ensuing season. These, as usual, are designated by letters, the meaning of which is here explained. These are: The Model U, which is of the semi-T.T. pattern; this model has a two or three-speed gear, but footboards instead of footrests, and upturned touring handlebars. Thus it is an ideal touring machine, but without the extra weight and complication of a kick-starter and a clutch, which are hardly necessary. The Model V, the genuine T.T. pattern—a fast light model, but with T.T. handle-bars, footrests instead of footboards, and a two or three-speed gear. This type is a universal favourite. The W, or touring model, fitted with kick-starter, clutch, touring handle-bars, footboards, and wider mudguards. The spring frame model, which is identical with the above, but with the addition of the newly adopted spring frame, which was described in our issue of November 25th, and the Model X, which is the much appreciated lady's Douglas. We now come to the 4 h.p. machines, of which there are two models—A, which is the touring pattern; and B, the sidecar combination.

Now the particular and favourite product of the Douglas firm is the 2¾ h.p. medium weight machine, the success of which has made the name of Douglas a household word, and it is therefore not surprising to hear that the lessons learned on the 2¾ h.p. in "The Great Reliability Trial" over the water have resulted in improvements which will be embodied, where possible, in all the models. We will take for our standard the perfected W.D., which, in its turn, is a perfected Colonial model. The most important lessons of all have been taught by two things—mud and *pavé*. To save wear, mud, which means grit, had to be excluded, and parts had to be strengthened enormously to withstand the shocks and bumps of the *pavé*.

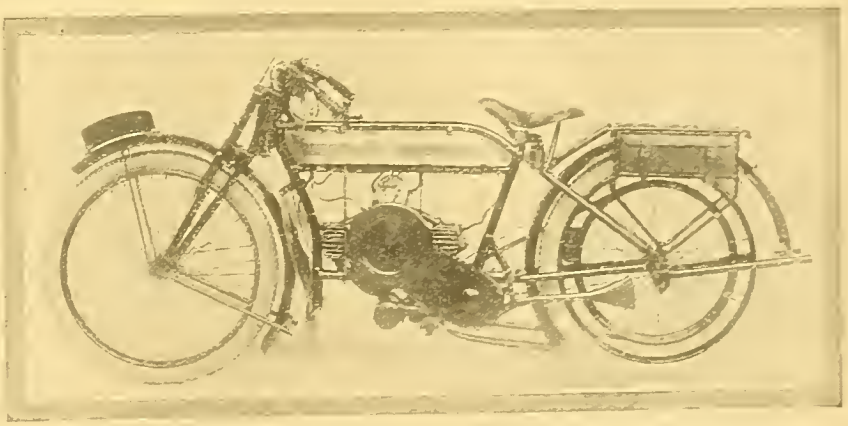
Strengthened and Improved Front Forks.

We noted, with great interest, the very wide hubs, which are behaving in a most exemplary manner "over there," and the immensely improved front forks, which have been greatly strengthened, and, so far, made more efficient, that they not only add to the rider's comfort, but save the frame from shocks which might ultimately result in breakage. The side links and the tube which forms a bearing for the spindle are now integral. This gives much greater strength, and ensures a much larger bearing surface, while large grease cups are provided, which serve to lubricate the moving parts and thus prolong their life. These grease cups are hexagonal in shape, so that when stiff, as may well happen when using a thick grease in cold weather, they may be turned by means of a spanner. Each side of the fork is a complete unit, and if one is damaged its replacement is a simple matter. Much larger springs, which in the Douglas forks are in tension, are now fitted, and the eyelet at each end is screwed into the spring. To absorb the heavier shocks a special device is fitted to the top links. A casting is situated behind the head, and in this there are two sets of springs, between each pair of which are blocks which carry the pins at the end of the links. This is a most excellent device, which may be fitted to existing machines of this year's date.

This design of fork is quite devoid of sideplay, has a special light cross member in front, which acts as a bracket for the front brake adjuster, and special holes in which the new forked lamp bracket is carried.

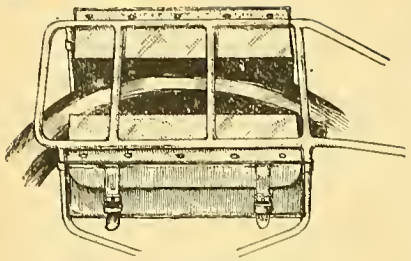
Extra Mudguard Clearance.

The mudguards are very wide, and, as can be seen from the illustration, the clearance between guard and tyre is exceptional, this being due to the fact that the Flanders mud often clogged the mudguards to such an extent that the wheels refused to revolve. The mud-



War Office model 2¾ h.p. Douglas, the result of actual experience with hundreds of machines on active service. Note large pannier bags, mudguard clearance, and supplementary front guard attached to down tube.

Douglases for 1916.—



Douglas carrier, showing extra long metal-covered tool bags.

guards are bolted direct to lugs brazed on to the frame. A most efficient front stand is fitted, which pivots on the ends of the front wheel spindle. The unusual width of the back forks is very noticeable.

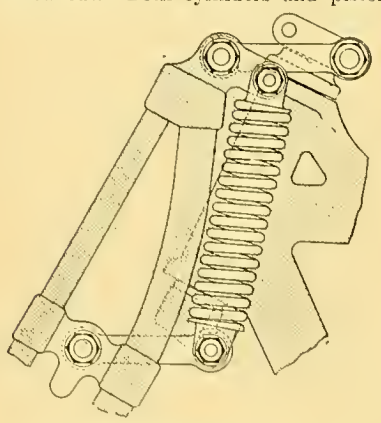
The rear brake is a great improvement over existing patterns. Its pedal is carried on a bracket separate from the footrest, and it is actuated by one rod running direct from pedal to brake shoe. This latter acts in the groove of the belt rim, and is compensating, so that on full pressure being applied the shoe is directly square and true with the belt rim. The front brake shoes are now far more accessible than in previous models.

The tank has been slightly altered in shape, and its appearance has been improved by rounding the edges, while both filler caps have been placed right forward, thus leaving room for a bag or parcel to be fastened to the top tube. Very large metal-cased tool bags extending the full length of the carrier are now fitted.

As regards the lubrication, the oil pipe from the drip feed to the engine now passes neatly through the tank.

Many Detail Engine Improvements.

It might not be thought possible that the Douglas engine was capable of much improvement, but really quite important alterations for the better have been carried out. Both cylinders and pistons



New design spring fork on the 1916 Douglas, showing strengthened links.

are entirely new. The former have greater radiating surface, the shape of the ports has greatly facilitated the admission of the mixture and the passage of the exhaust, and much unnecessary metal has been removed, thus making the engine lighter and yet considerably increasing its efficiency. The evils caused by the arch-enemy mud and grit have been combated by making the valve guides detachable. They are simply a driving fit in the cylinder, and in the event of an inlet guide being so badly worn as to prevent even running at slow speeds a replacement may be quickly and easily effected. Again, grit causes severe wear in the tappets, and this has now been prevented by fitting metal shields over these, which completely cover that part of the tappet which is continually moving in and out of the tappet guide.

A Lighter Piston.

The new piston is much lighter, but its strength is increased by the provision of four webs. An improved Amac carburetter is now fitted, in which the vaporising chamber is very adequately warmed by a tube leading from the front cylinder exhaust pipe to the large hot air jacket, whence the gases, having done their work, pass out through another tube to the silencer.

The silencer has been altered for the better, and the exit pipe, which now carries the gases from the top of the expansion chamber, is of large dimensions and has a fish tail end. Other improvements are a detachable back to the frame, so that in case of damage this portion may be easily replaced, while the spring frame may be substituted at any time should the owner desire it; also a new and most efficient belt guard and detachable footrests. Altogether, the latest W.D. Douglas is a delightful machine, and calculated to stand the hardest work in its country's service.

For 1916 all $2\frac{3}{4}$ h.p. Douglases may be had with either two or three-speed gears. The principal improvements in the 4 h.p. model were dealt with in the issue of October 7th.

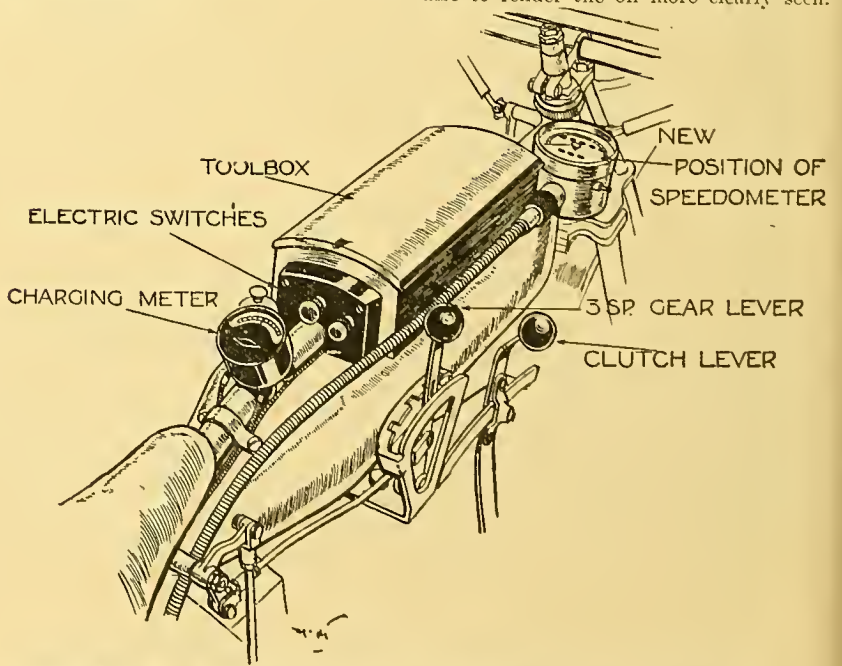
SOME FEATURES OF THE NEW 7 h.p. INDIAN.

WE have already dealt with the new 7 h.p. side-by-side valve long stroke Indian for 1916 (see issue October 21st), and the two accompanying sketches show the latest innovations on this model. The view of the top tube gives a very clear idea of the general arrangement of the

New position of mechanically operated pump in base of timing gearcase on the 1916 Indian engine.

electrical fittings and the new position of the speedometer, which can be now far more easily read than before.

The second illustration shows the arrangement of the oil pump. Note the screw at the back of the pump, which can be opened when it is desired to see if the oil is flowing freely, and that there is a total absence of air locks, which would otherwise interfere with its satisfactory working. There is a glass gauge (seen at the bottom) behind which is a tin disc to render the oil more clearly seen.



1916 Indian tank, showing location of tool box, speedometer, electrical controls, etc.

MILITARY NOTES.

A Couple of War Veteran Motor Cycles. News of Well-known Riders.

"FIVE BIG ONES."

THE following is an extract from the diary of Captain A. H. Loughborough, R.G.A., who is the brother of the secretary of the A.C.U.: "November 18th. At the park met Colonel Lindsay-Lloyd of Brooklands fame. . . . Lloyd and Loder turned up and stayed to tea, during which five big ones came over, apparently going in the direction of rest billets—no damage done."

PULLING HIS LEG.

A DESPATCH rider who recently enlisted was told by an officer and some men that the casualties among the D.R.'s were between 85 and 90%. In military parlance he got the wind up so badly that he wrote and asked us if it were true. We were able to comfort him by telling him that the casualties by shot and shell were comparatively small, but those due to tumbles and collisions, owing to carelessness and reckless driving, were considerably greater.

FOURTEEN MONTHS' DESPATCH RIDING ON THE SAME MACHINES.

WE hear a great deal of the short lives led by some motor cycles at the Front, and it is a decided relief to hear of machines still running that have been over in France since practically the beginning of hostilities. An instance of the latter is brought to light in one of the welcome letters we often receive from readers on active service. In the letter referred to, Despatch Riders D. Maple and F. N. Foster tell us that they are still riding 3½ h.p. Triumphs that have been in constant use under most trying circumstances for some fourteen months. Both mounts are running splendidly, and the engine of each has only been taken down once; the only trouble experienced has been the occasional snapping of the front springs due to frequent night riding over shell-holed roads.

THE RAW RECRUIT.

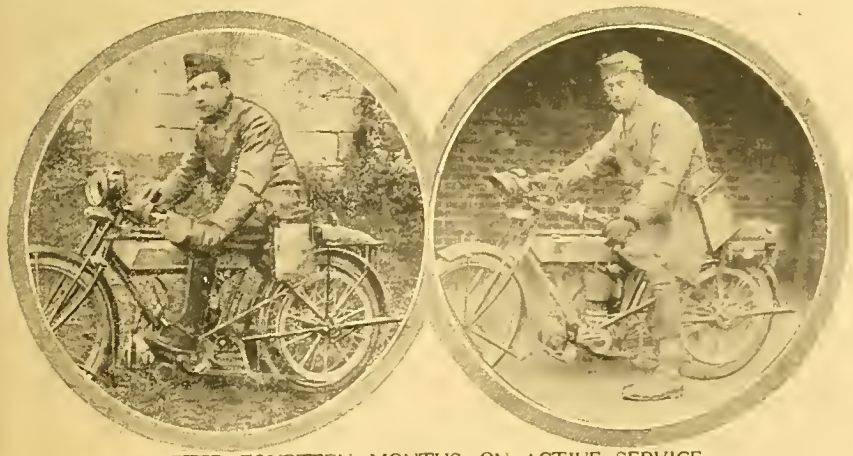
A group of R.E. despatch rider recruits photographed when joining a training centre. Shortly after the photograph was taken the men were put into khaki. Observe the "blue cover" in the foreground.

HOME AGAIN.

SERGT. HAROLD KARSLAKE, of the R.F.C., who has had nine months in the most advanced aerodrome in Northern France, has returned home and been appointed instructor at Reading University for the R.F.C.'s Officers' School of Instruction. Karslake is glad of the change, as conditions where he was located were never particularly pleasant.

A COMPARISON.

IT is interesting to compare the two pictures on this page, and in doing so it is difficult to realise that the war-stained veterans in the lower one were, only fifteen months ago, in the similar garb to those above. The seasoned riders look none the worse for their long service, and they are undoubtedly pleased with the splendid running of their mounts.



AFTER FOURTEEN MONTHS ON ACTIVE SERVICE.

A couple of 3½ h.p. Triumphs ridden by Corporals F. N. Foster and D. Maple.

WATER IN THE TRENCHES.

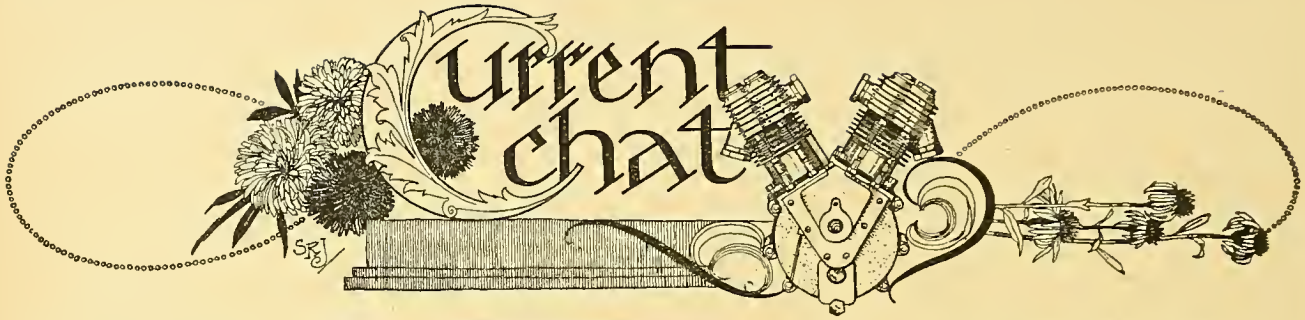
WE have received a letter from M. C. Breese, who was formerly a competition rider of B.S.A. machines. He writes: "I recently received my commission in the 8th North Staffs. Regiment. I have been out here despatch riding since January last, and have had my share of experiences in that line. I am now, however, having my turn in the trenches, and with water up to the top of my Hutchinsons the whole time it is not very pleasant. How I am looking forward to a bit of peace time riding! This is among the many things I am arranging for that happy time *après la guerre*."

COMMISSIONS FOR WELL-KNOWN RIDERS.

WE notice from *The London Gazette* that the following members of the Motor Cyclist Section of the Royal Engineers have been appointed Second-Lieutenants:

J. Erskine. G. T. Gray.
H. H. Dommett. H. R. Davies.

G. T. Gray is the well-known Rudge rider; he served with the 7th Middlesex in Gibraltar and later as a despatch rider in France. H. R. Davies has figured with great success on Diamond and Sunbeam machines, his most notable achievement being in the Tourist Trophy Race of 1914 on a Sunbeam, when he tied for second place, averaging 48.39 miles an hour over the course of 225 miles.



TIMES TO LIGHT LAMPS

GREENWICH TIME.

Dec	16th	.. ...	4.49 p.m.
,,	18th	... ...	4.49 ,,
,,	20th	... ...	4.50 ,,
,,	22nd	... ...	4.51 ,,

Which is the Worst Road?

A significant message from a well-known motor cyclist, writing from Crewkerne, is as follows: "Worst road in England is Salisbury-Shaftesbury. Just been over it!"

High Hedges on Corners.

A few months ago two motor cyclists were involved in an accident on the road between Barton and Broughton station (near Broughton village and Garstang), where a high hedge at a dangerous corner had already been the cause of danger to many road users. The A.A. patrol on duty on that road reported the full circumstances to his headquarters, and the owner of the land was subsequently approached. The need of improvement was urgently put forward, and the owner has now had the hedge cut down to a safe height.

Maker sees his Machines on War Work.

Mr. W. W. Douglas has just returned from an interesting trip in the war zone. The visit was connected primarily with the Douglas motor cycle, and after visiting the various bases and personally examining the actual conditions under which despatch riders and other users of motor cycles have to work, he is more than surprised at the present results the authorities are receiving. Mr. Douglas speaks in glowing terms of the capabilities of the D.R. as a motor cyclist, and he assures us that the past deeds of civilian experts are every day occurrences in the firing line. "Why," he says, "those fellows who went on strike in the last Six Days' Trial, when, you will remember, our machines were so successful, had an armchair ride to the trial of this great war! To see the riders dodging in and out long lines of transport trains for mile after mile, on shell plastered roads, furrowed twelve and eighteen inches deep by the overloaded lorries; to watch them sliding on the slimy mud, first here, then there, mastering just by an hairsbreadth an otherwise fatal skid that would leave them a crushed muddle of man and machine, not once, but time after time, until it almost becomes a monotonous series of thrills, makes one wonder how on earth any of the older hands exist to-day."

Lamps on Policemen.

The policemen at Eastbourne on point duty at night now wear red lamps on their belts back and front. Those who smiled at our hint that policemen would soon be provided with tail lights should note that the practice is growing.

Age Limit of Drivers.

The R.A.C. in conjunction with the Commercial Motor Users' Association propose to approach the President of the Local Government Board on the question of a reduction of the minimum age of holders of driving licences. The object is to meet the difficulty of the present shortage of drivers. It is suggested that the age limit for car drivers be reduced from 17 to 16 or 15.

Motor Cycle Mudguards.

After the unusually dry weather of November, a member of our staff was caught on a recent wet morning with his splashguards at one end of his daily journey and himself and his machine at the other. The roads were awash with rain which had fallen during the night, and consequently his feet were deluged with cold water which dropped from the front mudguard. The splashguards were refitted that day, and will remain in position until the spring brings dry roads again, for equally wet journeys have since been undertaken without any discomfort from road splashings. These splashguards extend from the top of the tank to the front of the footboards.

One of the uses of *The Motor Cycle* Buyers' Guide. The photograph was taken at the North Wales Motor Exchange, Wrexham.

SPECIAL FEATURES.

HOW WARTIME DEVELOPMENTS OF AEROPLANE ENGINES MAY AFFECT MOTOR CYCLE DESIGN.

A TOUR IN THE WEST COUNTRY.

Still Plenty of Petrol.

10,254,496 gallons of petrol were imported into this country last month. The figures for the same month of 1913 and 1914 are 8,629,174 and 10,614,143 respectively. Figures such as these are almost staggering, and convey better than anything else an idea of the gigantic proportions that motoring has reached.

Average Prices.

We give below the average prices of second-hand models offered for sale in *The Motor Cycle*. Where it is possible to obtain a sufficient number of each model the average for the past week is quoted. If there were not at least two advertisements, then the last occasion on which they were quoted is given.

Next Week's Issue.

In accordance with our usual practice, the next issue of *The Motor Cycle*, which will be published two days before Christmas, will contain articles of a seasonable nature.

The Benefit of Special Experience.

The new Douglas machines are illustrated and described in this issue. They are notable for the many improvements which have been effected solely as a result of experience in the war zone.

Motor Cyclists and Army Commissions.

We hear that commissions will not be granted to men who have not enlisted under the Group scheme, and, moreover, men who have served six months in the ranks and are under thirty years of age will receive preference. The new War Office scheme puts an end to the work of Officers Training Corps.

An Appeal to Motor Cyclists.

Many appeals have been made to motor cyclists, and the latest is one for a few men for evening work in the neighbourhoods of Westminster, Charing Cross, Piccadilly Circus, Middlesex Hospital, Covent Garden, Paddington, King's Cross, Whitechapel, Dalston, Poplar, and Southwark.

Unusual Cause of Accident.

It is seldom one hears of the breaking of a belt causing an accident, but a case of this kind occurred a few days ago, the victim being Lieut. Rex Brass, a member of the Durham M.C.C. Lieut. Brass was returning to duty by road, when the belt broke and became entangled in the back wheel. He sustained severe injuries to his right arm and shoulder, but is now progressing in a favourable manner.

The National War Funds.

At the week-end the principal relief funds stood as follow :

The Prince of Wales's National Relief Fund (£2,793,000 distributed)	£5,650,852	0	0
The *Weekly Dispatch* Tobacco Fund	92,000	0	0
The Times Fund for the Sick and Wounded	2,599,411	0	0
The Queen's Work for Women Fund	167,340	11	6
Daily News Xmas Pudding Fund	25,361	0	0
Daily Chronicle Xmas Gift Fund	20,485	0	4

Motor Cyclist Recruits.

During the past week many enquiries have reached the Editor from readers desirous of enlisting as motor cyclists in the Army, and enquirers have been recommended to enlist under Lord Derby's Group Scheme, notifying the recruiting officers that they are desirous of enlisting in a motor cyclist section when one is open. There is no guarantee that a man in the Group System can be accepted for a motor cyclist section, as there may be no positions open at the time the group is called up; but it is unlikely that the authorities will overlook the claims of experienced motor cyclists, at any rate, seeing that motor cycles form a standard part of the equipment of every division, and the more men there are enrolled the more motor cyclists will be required. As soon as motor cyclist sections are opened again for recruits announcements to that effect will appear in these columns as heretofore.

Well-known Motor Cyclist Killed.

While chatting with Mr. W. W. Douglas who has recently returned from a visit to the British Headquarters in France, we were informed of the sad news that Victor Wilberforce, a well-known Douglas rider who had joined the R.N.A.S.,

The late Victor Wilberforce, yet another well-known motor cyclist who has given his life for his country.

had been killed. Those who knew him as a good rider, an excellent sportsman, and a motor cyclist of the best type, will greatly regret his loss. Unfortunately, we have received no information as to how he met his end.

Rapid Promotion for Well-known Motor Cyclist.

As an example of rapid promotion, Staff-Captain W. B. Little is remarkable. He joined the Army just over a year ago, and he is now appointed on the staff of the 151st Brigade in the 2nd Army in France. He was one of the few survivors of the Durhams, who were so badly cut up in April last at Ypres. Except for being gassed in this engagement, he has come through scatheless thus far.

Staff-Captain Little, who will always be remembered for his motor cycle hill-climbing record in Lakeland and for his first ascents of Skiddaw, Helvellyn, and Sty Head Pass, has just finished a week's

Staff Captain W. B. Little.

holiday in his native county of Cumberland. Military duties have taken him from the motor cycle to the horse and the motor car.

In these days, when pessimism is apt to be much in evidence, it is encouraging to meet one with staff authority who is entirely optimistic. Staff Captain Little holds strong opinions that affairs in the Balkans are merely a "side show," and that the war will be settled in France. He has not the slightest doubt that we shall be able to break through when the time comes. That should be in the early summer, when, with full equipment of men and material, the banks of the Rhine will, at least, be reached. At present the weather bars everything. The same energy, indomitable pluck, and determination which carried the famous motor cyclist over Sty Head, Helvellyn, and Skiddaw will doubtless serve him and his country well in the onerous future which lies ahead.

A Manchester Police Decision.

On account of the danger to the public, the Manchester Watch Committee has framed a new regulation prohibiting motor and other vehicles overtaking tramcars on the near side when the latter are discharging or picking up passengers.

An Important Decision.

We learn that a certain popular section of the Army will obtain any further recruits it requires from time to time direct from existing sections. In other words, there will be no further civilian recruiting for this branch.

Subscriptions to the A.C.U.

Subscriptions to the A.C.U. will be shortly due, and it is to be hoped that all members will renew for 1916. The only body devoting its attention solely to motor cyclists is worthy of support from all those using motor cycles, and the withholding of a subscription to the Union is *not* an economy which we advise motor cyclists to exercise.

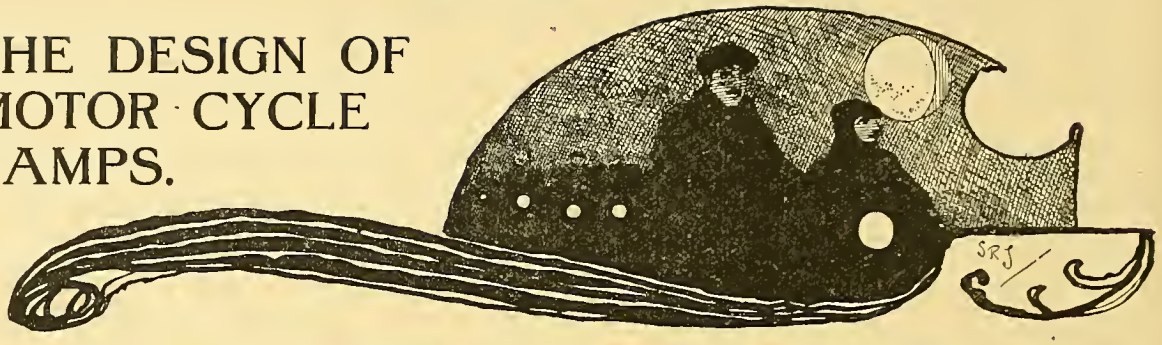
The A.C.U. and the War.

Since the outbreak of war the Auto Cycle Union has dealt with over 4,000 applications for motor cyclists desirous of enlisting as despatch riders, and of these 489 were passed as being suitable for this class of work, thus showing that considerable discretion was exercised in selecting the men. The secretary of the A.C.U., Mr. T. W. Loughborough, is also secretary of the London Motor Cyclists' Reserve Committee, and in one capacity and another is doing a great amount of useful work on behalf of his country.

The Value of Direct Observation.

Months ago motor lorry manufacturers were permitted to send representatives to the Front to observe the conditions under which their products were used in the hope of valuable lessons being gained. We commented favourably upon this commonsense decision at the time, but it is only during the last fortnight that motor cycle manufacturers have obtained permission to visit the different bases in France in order to observe their machines in active service. Mr. W. W. Douglas's impressions after a visit to the Front are given in this issue.

THE DESIGN OF MOTOR CYCLE LAMPS.



THE efficiency of a motor cycle acetylene lamp depends primarily on its optical construction, and secondarily on the candle-power of its light. The chief faults of a badly constructed lamp are undoubtedly due to loss of light, either by diffusion or absorption. Perhaps loss by diffusion is rather a general term, and waste of light by allowing it to fall or pass where it is not useful should be substituted.

There is very little absorption of light in the lamp, for all the interior parts are well polished, and light, like heat, is reflected by shiny surfaces, whilst it is absorbed by dull or black surfaces. It is a well-known fact that if the polished parts of a lamp are allowed to become dull its efficiency is thereby reduced. It would, perhaps, be advisable to explain here that the efficiency of a motor lamp means the ratio of the light emitted through the transmitter to the total light emitted by the source of light. (The front glass through which the light is transmitted is called the transmitter for convenience.) In well designed lamps most reflected light, including that which is lost in badly designed lamps, is collected and thrown out in a straight, well-defined beam of light. This kind of light is most essential for country roads, but it is unsuited for town work, being too "harsh" and blinding. The kind of light most suited for town use is a soft light with no particular penetrating powers. This, no doubt, will suggest some mechanical device by which the light emitted from the lamp may be adjusted to give this soft diffused light or the "harsh" penetrating beam at will, and it is actually effected on some of the later type of lamps by a small adjusting screw at the back of the mirror to move it nearer to or further away from the source of light.

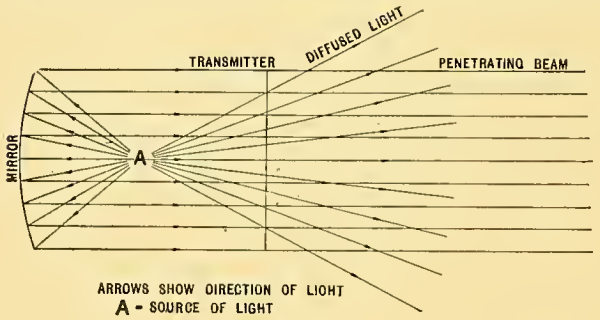


Fig. 1.

A Comparison of Metal and Glass Mirrors.

The most important points in the optical construction of a lamp are the mirrors, lenses, and their arrangement. These vary in quality proportionately to the price paid, from those ground optically correct to metal mirrors. Those which are ground optically correct are usually silvered glass, and are the most expensive. They are ground so that each is part of a true parabola, and the nearer they are to being parts of true parabolas the better are the results obtained from their use, consequently the more efficient are the lamps to which they are fitted.

Metal mirrors do not possess such good reflecting powers, neither can they be made so near to being optically correct as the silvered glass. Thus, with a metal reflector more light is absorbed, more light is diffused, and therefore more light lost.

Standard Constructions.

There are several standard optical constructions in lamps familiar to the motor cyclist, some simple and some complex. The simple type usually consists of a concave mirror for a reflector and a plain glass transmitter. The complex type usually consists of a concave mirror reflector and a transmitter composed of a convex lens set in the centre of a circular piece of plain glass.

Let us consider the light from a source of light emitted in the form of rays, and the rays represented by lines. Then the light emitted from a lamp with a simple optical construction is shown in fig. 1.

It will be noticed in this figure that all direct rays diverge from the light, diffuse over a large area, and are very soon lost, whilst the reflected rays are parallel and are thus collected together in one straight beam of light.

How to Find the Focus.

There is only one position of the light, with regard to the concave mirror, when all reflected rays are parallel, and that is at what is termed the Principal Focus of the concave mirror. This point may be obtained for any concave mirror by taking a source of light which will give practically parallel rays such as the sun, and fixing a paper screen in front of the mirror so that an image of the sun is focussed clearly upon it. Measure the distance between the screen and the centre of the mirror, and this distance, known as the focal length, will be the correct distance of the acetylene light from the mirror in the lamp, for if all rays of light from the sun incident on the mirror are reflected to this point, then all rays of light from this point incident on the mirror will be reflected back to the sun. Therefore, following this line of reasoning, the distance that a beam of light so reflected will travel is proportional to the candle-power of the light.

The Design of Motor Cycle Lamps.—

The complex type of acetylene lamp is rarely used by motor cyclists, and even on cars it is not so much in evidence as the simple type. The light emitted from a lamp of the complex type is represented in fig. 2. The source of light is so placed

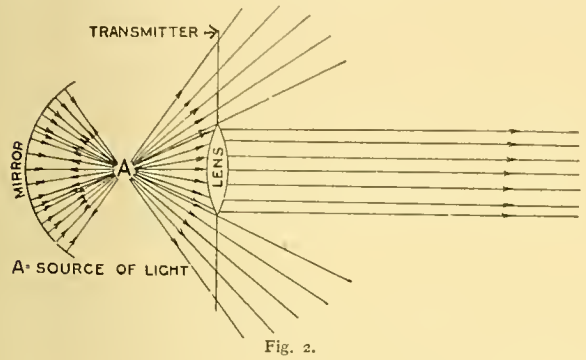

Fig. 2.

that all direct rays of light which fall on the small convex lens will be transmitted in parallel rays, and all reflected rays will be reflected along their own paths, consequently those reflected rays which finally fall on the lens will be transmitted in parallel rays, whilst all direct and reflected rays which fall on the glass will diverge and diffuse. This gives a smaller but more penetrating beam of light, and a stronger diffused light on the surroundings. It is apparent that the size of penetrating beam depends upon the size of convex lens used in the transmitter; in fact, it is possible to convert all the rays of light emitted from the lamp into parallel rays by having a convex lens for the complete transmitter. An experiment was once conducted on these lines by the author, and a tremendously powerful penetrating beam of light was obtained, but there was practically no light on the immediate surroundings, and it would have been dangerous to have ridden at night with the lamp as a sole means of light. The point at which the light is placed in a complex type of lamp is the principal focus of the convex lens.

Why Mirrors should be Truly Ground.

It is now fairly obvious why mirrors and lenses should be ground accurately, *i.e.*, in order that all rays of light shall traverse the path they are intended to traverse. Supposing, for instance, that a given

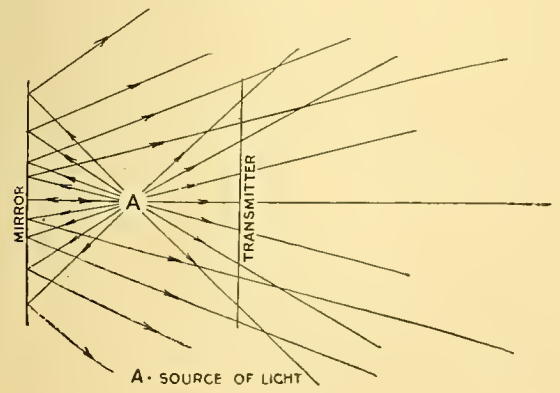

Fig. 3.

concave mirror was not truly ground but had small flats or bumps, each of which constitutes minute portions of different spheres, then the principal focus of each of these minute portions and the main sphere would not be coincident, consequently all rays of light incident on the given mirror would not be reflected in parallel rays—there would be diffusion, and the beam would not be so penetrating.

Some readers will be wondering why a plain glass mirror would not serve equally well. A cursory glance at fig. 3 will suffice.

Approximately 66⅔% of the light incident on the mirror is reflected to the top and bottom of the lamp, whilst there is no penetrating beam which is so essential for country driving. So much for acetylene lamps.

Electric Lamps.

Now let us consider the electric lamp, the lamp which has great possibilities before it. Not only is the electric lamp a reliable, convenient lamp, but as regards efficiency nearly 100% of the total light is

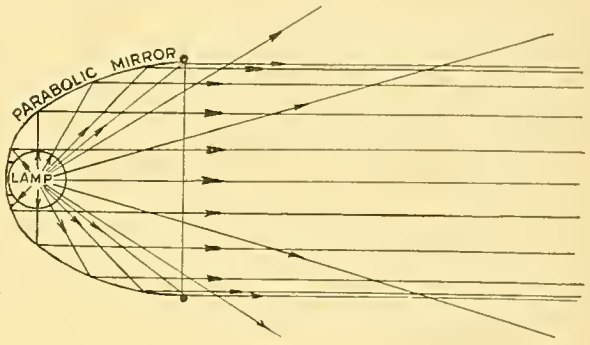

Fig. 4.

emitted from a good electric lamp, whereas, in its rival acetylene, there is loss of light by absorption and contra reflection. The modern electric lamp consists of a parabolic mirror made of metal or optically ground correct silvered glass, with the light set at the focus of the parabola (see fig. 4).

This parabolic mirror is a concave mirror whose surface is generated by revolution of the arc of a parabola about its axis, and so constructed that all rays incident on its surface are reflected in parallel rays giving the necessary penetrating beam, whilst the diffused light to show up the surroundings is given by the direct rays. It is obvious from fig. 4 that all the light is either reflected, or passes direct through the transmitter, and that loss of light can only occur by absorption, which is, as aforementioned, practically negligible. As in the acetylene type, an adjusting screw is fitted to some of the later types of electric lamps, so that the penetrating beam may be diffused at will for town riding. This is usually connected to the electric bulb itself, so that it can be moved, as it were, "out of focus," and if the light be brought nearer to the reflector the rays will be more scattered.

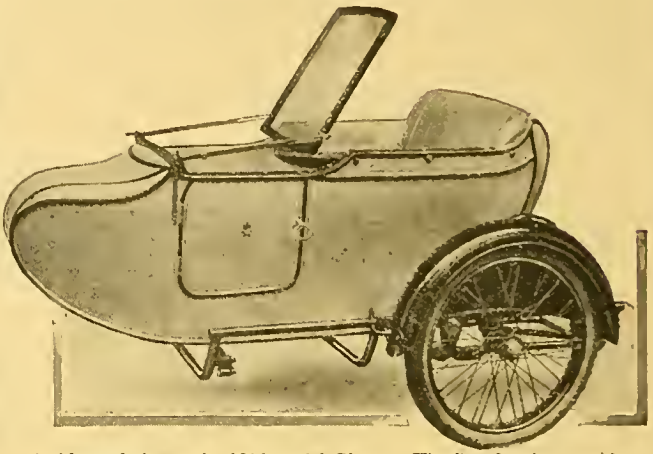
Summarising, one might say that the best light for town driving is a diffused light, whilst for country driving sufficient diffused light to show up the immediate surroundings and a penetrating beam which should show up objects at least 100 yards away is most desirable.

LUX.

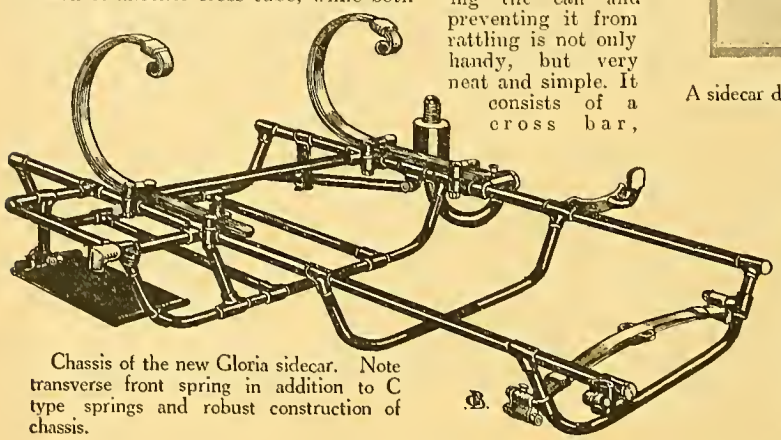
A New Design Gloria Sidecar.

All Fittings Brazed—Luxurious Suspension.

THOUGH the Gloria Cycle Co. are in much the same position as most other large manufacturers—that is, their chief energies are devoted to the manufacture of munitions—yet they are able to devote some little time to their usual work, and the latest pattern Gloria sidecar has many attractive features. The alterations, however, from previous models are in detail only. The chassis has been improved and strengthened in several ways, perhaps the most notable being that all the fittings are brazed to the frame instead of being clipped as previously. Other points also have received attention. The main frame has still further been stiffened by the addition of another cross tube, while both the luggage carrier and spare petrol tin carrier have been strengthened. The luggage grid is formed by an extension of the chassis, and is now constructed of heavier tubing. The petrol tin carrier is situated in the space between the rear cycle connection and the bicycle, and the method of securing the can and preventing it from rattling is not only handy, but very neat and simple. It consists of a cross bar,



A sidecar de luxe—the 1916 model Gloria. The line drawing on this page shows the luxurious springing employed.



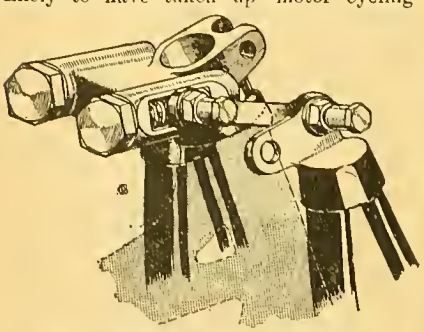
Chassis of the new Gloria sidecar. Note transverse front spring in addition to C type springs and robust construction of chassis.

which is held by a single wing nut. The spring wheel that has proved so satisfactory for the past three years has, of course, been retained, and has not been altered except that the bearing on which the arm supporting the wheel is attached is now of the ball-bearing type. Four-point attachment is used, and all joints are capable of being rapidly detached.

The rear spring axle passes right through the body, and is connected to the springs by shackles. Several novel features are incorporated in the body. Padded arm rests are now provided. There is ample room for storing tools and spares, as lockers are arranged behind the seat and also under the cushion.

Drop in Second-hand Prices.

AS usual, the advent of winter has had the effect of reducing the prices asked for second-hand motor cycles, and there is no doubt that the present uncertain times, with so many of the men who were likely to have taken up motor cycling

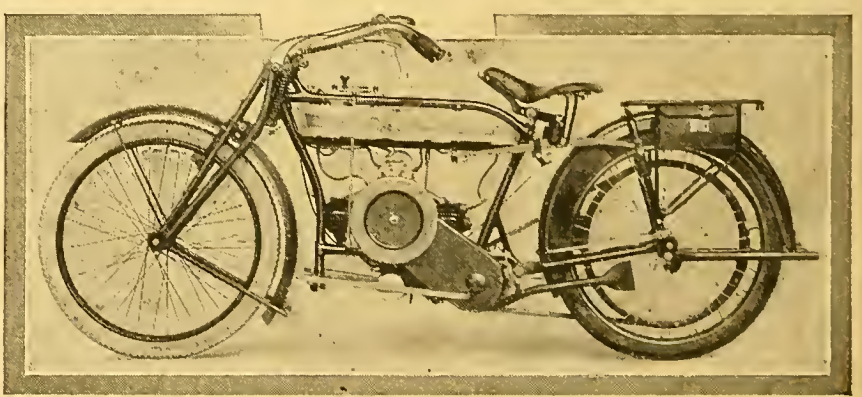


In the new Douglas front fork provision is made for backward and forward movement, as shown in this sketch, in addition to upward and downward movement. (See pages 607 and 608.)

having either already enlisted or been attested under Lord Derby's scheme, have assisted in still further reducing the average prices of 1914 model machines.

In comparing the average second-hand prices quoted for this week with an average taken for August and September it is interesting to find that in sixteen well-known machines selected at random the average drop in prices is £4 per machine. In three cases the drop is to the extent of £7, £10, and £12 respectively. On the other hand, three makes, namely, two models of Triumph, Scott, and Indian, have gone up slightly, the Scott and Indian having gone up to the extent of £2 (the latter no doubt due to the new tariff), while Triumphs have gone up £1—possibly owing to the difficulty in obtaining deliveries due to war requirements.

The advent of spring, with finer weather and, let us hope, more settled conditions, will no doubt again have the effect of sending the prices up. Even in times of peace it is never wise to sell at the end of the year if it is possible to hold over to the following spring.



The 2¾ h.p. spring-frame Douglas, showing entirely enclosed chain and latest design silencer outlet pipe. The Douglas spring frame was described in *The Motor Cycle* of November 25th, and the 1916 models will be found on pages 607 and 608 of this issue.

LETTERS TO THE EDITOR

The Editor does not hold himself responsible for the opinions of his correspondents.
All letters should be addressed to the Editor, "The Motor Cycle," Hertford Street, Coventry, and must be accompanied by the writer's name and address.

Carburetter Adjustment.

Sir,—I notice in the issue of December 9th two letters asking how to get a good m.p.g. from a Scott. I possess a 1912 Scott, to which I have fitted a 1915 Binks three-jet carburetter. Most of my riding is short distances, but in six weeks in August and September last I did 900 miles on eleven gallons of Pratt's No. 1, i.e., 82 m.p.g., of course without a sidecar. About 500 miles of this was in Wales. I use Nos. 0, 3, and 7 size jets, and generally ride with the extra air slightly open and ignition fully advanced. Using the two pilot jets, I can get about 30 m.p.h. on the level and climb anything in reason.

I should strongly advise Messrs. Yearsley and Stanley to read, mark, learn, and inwardly digest the excellent hints on tuning a Scott given in your issues of July 15th and 22nd, particularly in reference to sealing up the transfer ports. (Rev.) J. M. PHILPOTT.

Sir,—In reply to the letters from V. B. Yearsley and J. F. Stanley. For a long time I was only getting 45 miles to the gallon with the sidecar attached, or 50 with very careful driving. I tried quite a number of different needle positions, but must say the adjustment of the needle never made more than 10 miles per gallon difference. Anyway, I found the most economical and efficient position of the needle, and then found that there was one economical position of the petrol and extra air lever which gave really extraordinary results. This position gives me a speed of

Mr. Hockney's Scott passenger outfit. See letter on this page concerning petrol consumption.

30 m.p.h. on the level with sidecar, and I keep the levers in this position as far as possible.

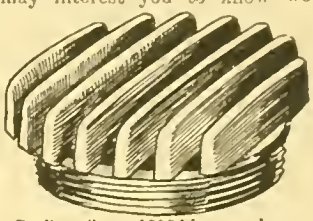
I have just measured the position of the levers, and the throttle lever is 2in. from the fully closed position (measured on the extreme radius of the lever), and the air lever is 1¾in., so that they are almost equally open. The air lever is then central with the handle, and the petrol lever ¼in. off the centre. I find that if I open the petrol lever beyond the position indicated I have to close the air lever considerably, and yet get no more, and in fact less, power, until the petrol lever is opened considerably more.

W. HOCKNEY.

Valve Cap Cooling Devices.

Sir,—In view of the article *re* valve cap cooling in your issue of December 9th, it may interest you to know we introduced a radiating cap for Norton machines during 1909, and forward one of a pair used in the I.O.M. during that year.

NORTON MOTORS, LTD.



Cooling ribs on 1909 Norton exhaust valve cap

Sir,—I note in your leading article on "Cooled Valve Caps" the last paragraph, which reads as follows: "Improvement in running can directly be ascribed to the complete and even cooling of the hottest parts of the engine, viz., the cylinder heads, by the elimination of valve caps."

I would like to suggest that the hottest part of an engine is the exhaust valve, and if provision can be made to cool this important part the engine will not overheat. This had been proved without any shadow of a doubt with the De Lissa air-cooled exhaust valve as used on a 3½-4 h.p. Motosacoche machine.

This valve also does away completely with the exhaust valve cap which you state is the hottest part of the engine, so you can quite imagine, with an air-cooled exhaust valve and no valve cap, there is no reason why an air-cooled engine should get hot.

On all other engines provision has been made to cool the cylinder, but no provision has been made to cool the valve, which is undoubtedly the hottest part, and the accumulated heat spreads to the piston, as it is always on the exhaust valve side that the rings are carboned up and burnt. Moreover, this dries up the oil and then heat from friction begins, which causes seizing up and the general overheating troubles. MOTOSACOCHE, LTD.,

Osborne de Lissa, Managing Director.

The Lady Motor Cyclist—A Protest.

Sir,—Your correspondent "Logistes" seems a bit spiteful when she expends such an effusion of satirical remarks on high heels, stays, and the hobble skirt.

She is wrong when she says that a lady's motor cycle is more difficult to dispose of than a man's. The demand for a lady's second-hand model of a good make is tremendous, and I have found over twenty buyers for each of my machines. But, of course, there are motor cycles and motor cycles, and perhaps your correspondent had one to dispose of which had not a reputation.

"Medico" should try an up-to-date lady's mount of medium weight, plenty of power, and perfect construction, and he will find that it is possible firmly to hold the handlebars of some ladies' mounts at over 20 m.p.h. Why, my mount will do over 50 m.p.h., and, being of the horizontally-opposed type, there is not the slightest vibration at this speed, and I am willing to back it against any man's machine for comfortable riding and absolute absence of vibration.

Furthermore, if knee grips are so essential to the rider's steadiness and safety as "Medico" endeavours to suggest, can he reconcile the fact that knee pads are not to be found on 5% of men's models. MARY REID.

Scott Lubrication.

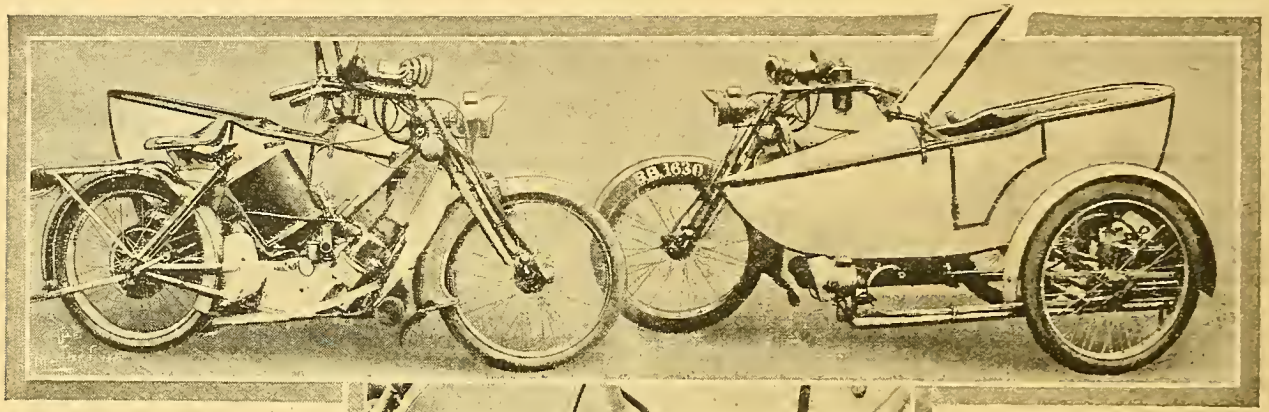
Sir,—I have ridden a Scott for a long time, and was always dissatisfied with the oiling arrangements, both the pump and the single drip feed. My objection was that one could never get each cylinder to take an equal share of the oiling I remedied this by cutting off the single drip feed arrangement and fitting a Best and Lloyd drip feed to each cylinder, using the ordinary spring pump to supply it.

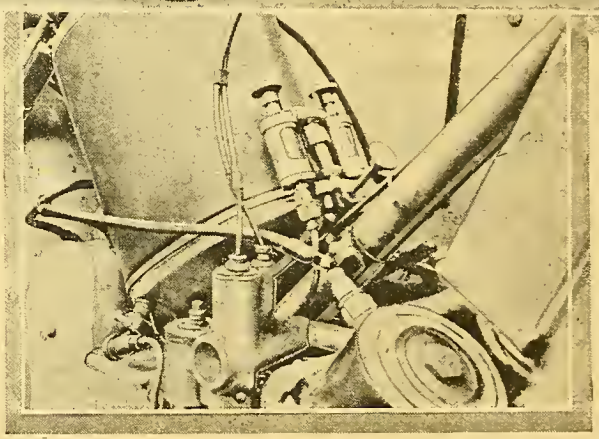
I may say since fitting the above I have never had any oiling troubles, and before I had several seize-ups. I should also like to state that I ride with a fairly heavy coachbuilt sidecar, and the petrol consumption comes out between 55 and 60 m.p.g., Binks carburetter fitted.

I enclose a photograph of the machine, which shows very plainly an aluminium chain case which I made to replace the Scott one, which I did not like. The machine is a 1913, with all the latest improvements, and is enamelled French grey. The sidecar was made entirely (except chassis) by one of my lance-corporals. It is made with an ash framing, covered with three-ply wood, enamelled French grey, and upholstered with green Rexine, and is quite light. The total cost, including chassis and tyre, and £3 which I gave the man for his work, was £8.

My only regret is that Messrs. Scott do not build a machine about 800 c.c., because for comfort I think Scotts are unsurpassed, and I have ridden a few makes.

J. W. DODDS (CAPT.).





The lubrication system on a reader's Scott—the outfit referred to in the letter on this page from Capt. Dodds.

A Good Climb.

Sir,—The following may possibly be of interest to you. Parbold Hill is a well-known test hill just north-east of Ormskirk, near Liverpool, and was in the early days the test ground for motor cyclists before variable gears came into vogue. Even to-day car manufacturers and agents quote performances at Parbold as a guide to the capabilities of their vehicles.

Having recently purchased a second-hand 6 h.p. water-cooled horizontally-opposed twin Humber, and fitted a sidecar, I decided to run along there and see what the machine would do. To my intense astonishment, I climbed the hill on the top gear—4¾ to 1—without slipping the clutch, or other assistance—a fair and square steady pull.

The sidecar is coachbuilt, fitted on to a heavy Millford chassis. I had a passenger (with rug), and we were both of us clothed for very frosty weather.

I have not yet done 100 miles on the machine, and went up the hill with the ordinary jet as supplied by the makers.

I have made enquiries, and cannot hear of anyone who has got up this hill with a sidecar on a gear of 4¾ to 1, irrespective of the horse-power. It, therefore, appears to me to constitute a record.

As you well know, the engine is only a 745 c.c., and the whole machine is exceptionally heavy for its size. On the same day, in a speed test, I touched 48-50 m.p.h., using the same gear and jet.

S. W. PHILLPOTT.

Dangers of Darkened Streets.

Sir, — Your correspondent, "Sole Member for the Society for Illuminating London," tells us many things but proves none of them. The darkening of the streets was not expected to prevent the Zeppelins from reaching London; the object was to prevent them from picking out any particular object. Our own airmen reported that they could no longer discern important buildings and places, and this led to the further darkening order.

Also, if we allowed motor vehicles to use powerful lights, it would be comparatively easy for a Zeppelin to pick out an important London street by the number of bright lights proceeding along it.

Please do not think that I am a bigoted non-motorist, for I own both car and motor cycle. I fully appreciate the difficulty of night driving, but think it is one of the things due to the war which we must accept cheerfully.

C. BINGHAM, JUN.

Sidecar Windscreen.

Sir,—In reply to the correspondent "A Nine-year-old Reader," I do not use a windscreen during the summer months. The rough weather of winter is the only time that I consider justifies the wind resistance of a screen. Still, I believe my fitment is devoid of the defect "A Nine-year-old Reader" complains of. With regard to the screen the reader fitted, it an increased current of air was just behind the passenger with the screen close, would not moving the screen further forward bring the draught in the passenger's face? This was my experience with the shield I first had fitted. Probably my screen is larger and more gradually sloping upwards, and the meeting of the currents of air from it is, therefore, thrown much farther behind.

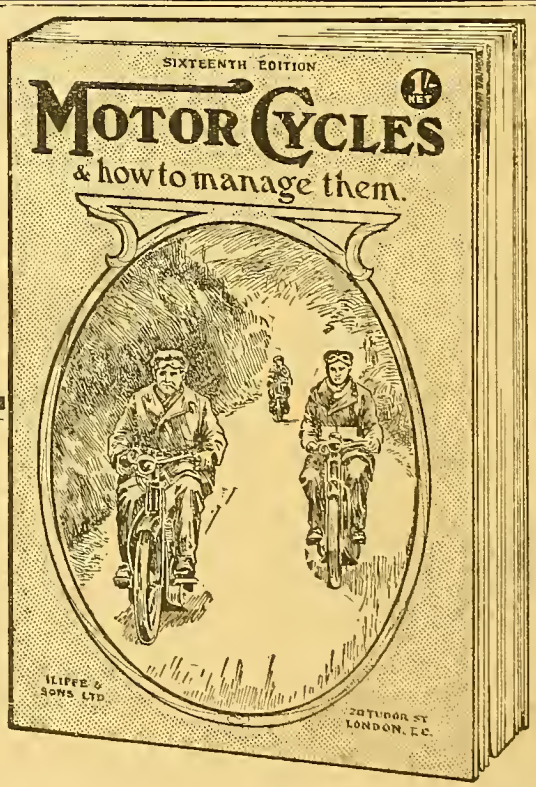
To enjoy motor cycling *thoroughly* you must understand your machine *thoroughly*



Get the **16th Edition** (Revised) *of this useful book*

"MOTOR CYCLES & HOW TO MANAGE THEM" — the standard handbook for motor cyclists — will tell you practically all you want to know about your machine.

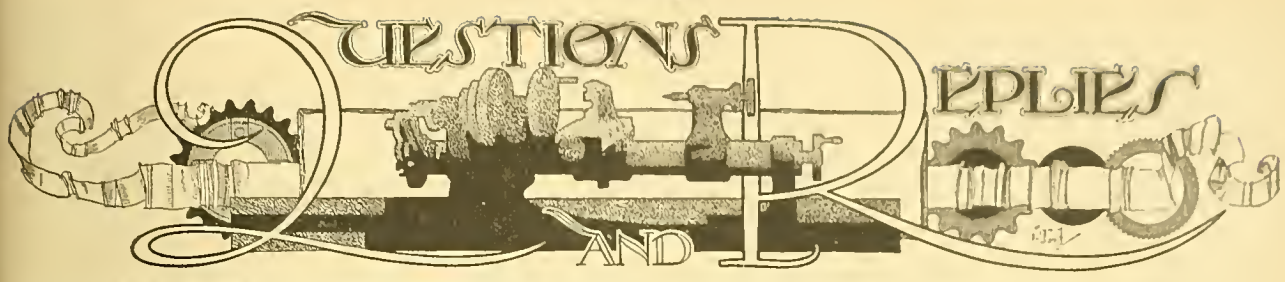
¶ There is no doubt as to the supremacy of this book over all others of a similar kind. It is constantly being checked and revised by the staff of "The Motor Cycle," and consequently carries the weight and authority of this journal.

¶ Its contents embrace a multitude of subjects relating to motor cycles, their care and management. It is clearly written and well illustrated. Every motor cyclist—whether beginner or experienced rider — should keep a copy handy for reference.

Price 1/- Net

By Post 1/4

Obtainable from ILIFFE & SONS Ltd., 20, Tudor St., London, E.C., and all booksellers and bookstalls.



A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, London, E.C., and whether intended for publication or not **must be accompanied by a stamped addressed envelope for reply.** Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

An Extraordinary Allegation.

Recently I hired a motor cycle, and on taking it back to the dealers they accepted it, but the next day sent me a letter saying that I had removed the original piston and replaced it with one of another make. They are claiming from me the price of a new piston. Have they any claim?—G.S.K.

To accuse you of having removed the original piston and put in another one is certainly a serious allegation to make, and we should advise you to ask them what proof they have that the piston was removed while the machine was in your possession. Unless they have any proof the garage people certainly have no claim upon you.

Sluggishness in Starting

Can you tell me why I have difficulty in starting my motor bicycle? It is a 2½ h.p. four-stroke. It is chiefly when the engine is cold that I find difficulty in starting. I have done about 500 miles on it, and have been continually troubled in starting the machine.—S.H.I.

If the machine is difficult to start, owing to its being stiff to push when cold, it is due to the oil in the engine becoming congealed owing to the cold. It can be freed to a great extent by injecting a few drops of petrol or paraffin through the compression tap before trying to start, turning the engine over once or twice to enable it to work past the rings. In order to get an easy start you should have the following adjustments correct: Contact breaker points clean, and separating .4 mm., and you should make sure the rocker arm is not sticking. Carbon brush on magneto should be free from oil or dirt. Plug points should be clean, and with a gap of between ½ and 1 mm. Valve tappets should have a clearance when cold of about $\frac{1}{32}$in., and the carburetter should be clean. In most machines the usual setting of the levers for starting is air closed, throttle about a quarter open, and spark fully or nearly fully advanced. If the carburetter is any make except a Senspray it is advisable to flood it slightly before starting by depressing the plunger on top of float chamber. If you follow these instructions there should be no trouble whatever. You would find "Motor Cycles and How to Manage Them" a useful book.

Notice of Intended Prosecution.

Please tell me if it is a fact that notice of intended prosecution must be given before the expiration of twenty-one days from the time the offence was committed, namely, exceeding the speed limit, or is this only a legal quibble, conviction following nevertheless. I was trapped, told my speed, particulars were taken, and my address confirmed, but nothing has since happened, and seventeen days have already elapsed. No mention was made of the summons even verbally at the time of the offence. —F.W.F.

In the case of an offence for exceeding the speed limit notice of summons must be given at the time the offence is committed or within twenty-one days, otherwise a conviction cannot be obtained. This is usually done at the time verbally by the policemen working the trap. If they did not do so on this occasion it was probably an oversight.

Unevenly Worn Cylinder.

My motor cycle is a 1912 3½ h.p. I have purchased two new piston rings from the makers, believing that soon I shall require them. The piston head has two rings at the top, consequently the bottom of the cylinder is not worn at all where the rings do not reach when the piston is at the bottom of the stroke. Therefore I cannot get the new rings into the bottom of the cylinder, being too tight, but no doubt they would fit better a little higher up where the cylinder is worn. Will you kindly advise what had best be done? —H.W.H.

If your cylinder is so badly worn that you are unable to get the piston rings in at the bottom of the cylinder, yet they fit easily when at the top of the stroke, the only remedy is to have the cylinder rebored and a new piston and rings fitted. You should carefully measure the cylinder with a pair of callipers, and if the difference between the top and bottom of the bore does not exceed, say, one or two thousandths of an inch, there is little need to have it rebored for some time, in which case, to make the rings fit, you should file a little off the ends, so as to allow them to compress a little more. There should be about ½ mm. clearance between the ends when the ring is placed absolutely squarely in the cylinder.

Loss of Compression.

I have a 1914 4¼ h.p., single cylinder, and up to the present it has been running well, but it is now losing compression. Could you please tell me the cause of the trouble and how to cure it? The cylinder has not been taken down and cleaned yet, so would this be the cause?—S.G.D.

Loss of compression is due to the valves requiring to be ground in, or valves not closing properly owing to the valve tappets requiring adjustment, worn piston rings, or piston. If you take the cylinder off to clean the piston and cylinder head of carbon deposit, also remove the rings and clean the carbon deposit from behind these, and see that the valve springs are strong enough.

Knocking.

I have a 4 h.p. two-speed machine which, after running a few miles, starts to knock on slowing down. Shutting off the air sometimes stops this, but on opening the throttle again it knocks very badly for a few minutes, but generally leaves off on the level. If I run at a greater speed than twenty miles an hour the engine gets hot and starts knocking. In climbing nearly every hill I have to shut off the air. If I am climbing a long hill the engine pulls well on top gear, but knocks badly all the time, and even changing into low gear does not stop the knocking. The result is that the engine overheats and generally stops at the top. After cooling down it starts up quite well again in low gear. There is not much carbon deposit. I give plenty of oil.—S.H.T.

The trouble is probably due to the use of a sparking plug which does not suit the engine. A good single-point plug of first-class make should be used. It is not uncommon to have to close the air a little to prevent the engine knocking on hills. We presume the machine is not geared too highly? You might also look to the tappets and make sure the clearance is not too great; $\frac{3}{32}$in. is about right. Too small a jet would also cause knocking. If a general tune up does not remedy the trouble, you should take the cylinder off and make certain the rings are quite free in their grooves, that the piston is quite true and not binding, and the bearings in order.

SPECIAL NOTICE.—*Copies of "The Motor Cycle" may only be sent to neutral European countries if posted direct from the offices of the publishers, or by newsagents who have obtained permission from the War Office for this purpose. The publishers of "The Motor Cycle" have obtained the necessary permission, and, consequently, can send subscribers' copies as usual. Before sending through newsagents it is important to enquire if permission has been obtained, as otherwise copies intended for neutral European countries will not be forwarded by the Post Office.*

Registration of Second-hand Machines.

I have bought a second-hand machine. (1.) Do I have to get a new number, or can I use the old one? (2.) What steps do I have to take for insurance?—P.D.T.P.

(1.) If the previous owner is willing you can have the existing registration number transferred to your name at a cost of 1s. If he is not, you must obtain a new number from any county or borough council office at a cost of 5s. (2.) You should write to the Insurance Manager, *The Motor Cycle*, Hertford Street, Coventry.

Broken Overhead Valves.

I have an 8-10 h.p. machine with overhead valves. Now I do not like the idea of the valves breaking and dropping in the cylinder. Do you think I could lessen the risk of that if I had touring cams put in the timing gear in place of the racing ones, and would it stop a lot of the clatter? The above are the only faults that I have against it, as the machine is simply grand. I fitted a sidecar to it, which caused it to knock at times, but I have overcome that by fitting two $\frac{1}{16}$in. plates between the cylinder and the crank case, but I am always afraid of a valve breaking and falling into the cylinder. It is not because of the price of a new one, but perhaps the fitting of a new cylinder might alter the running of the machine.—E.A.

The fitting of touring cams would undoubtedly lessen the risk of broken valves, and would probably reduce the clatter to some extent. There are quite a number of ideas for preventing the heads of broken valves falling on to the piston and causing damage. Probably the best is to fit three hooked metal pegs into the cylinder head round the valve, the hooked portion being far enough away not to interfere with the opening of the valve. If the valve should break, the head is caught by the hooks of the three pegs. The chief disadvantage of this method is that, unless the pegs are fairly substantial, they might cause pre-ignition by becoming incandescent. Another method more or less satisfactory is to drill the stem of the valve and fit a steel wire in, riveting it at each end, the idea being that if the valve should break the wire would hold the valve head from falling into the cylinder while the machine is being stopped. There is no doubt that this method weakens the valve very considerably. It is, moreover, we believe, patented.

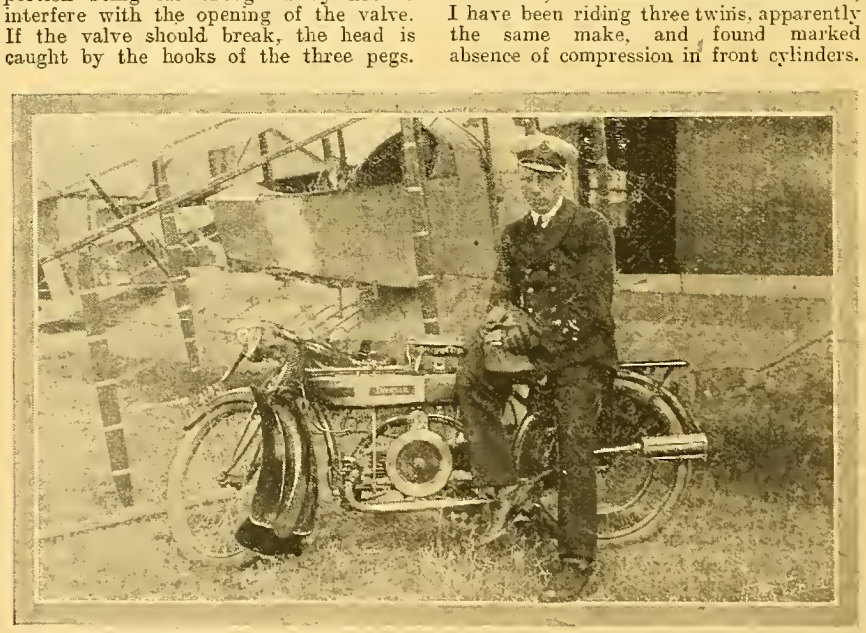
READERS' REPLIES.

Misfiring.

In answer to "L.C.F." in *The Motor Cycle* of November 25th *re* his 1915 machine with 1915 B. and B. carburetter misfiring on long hills, I have had the same trouble with my 1915 Calthorpe Junior, Precision engine and 1915 B. and B. carburetter. I ran same for 800 miles with a lot of trouble, and always seemed to misfire on long hills. I tested everything, and at last sent it to my engineer, who had the engine, etc., right down, but could not find any fault, and it was just as bad when I got it home again. It was not long after that I found out the cause in the B. and B. carburetter. One slide (throttle) faces the engine and the air slide faces footboard, and the calf of my leg covers up the slide, only allowing a little air to be drawn in, which causes misfiring. I have remedied this by altering footboards, and have never since had any trouble, although I have ridden 1,500 miles. I have only got to shift my leg a little, and I have the old complaint, so I think that if "L.C.F." tries my idea he will not be troubled again from misfiring.—A. MORGAN.

Tuning Up.

In reference to your correspondent "O.W.Y.," of issue of November 25th, I have been riding three twins, apparently the same make, and found marked absence of compression in front cylinders. I ground in the valve, etc., but found no improvement even after fitting new ring. I submitted the difficulty to an expert, who said it was probably due to warped valve seating, and that a new cutting would be required to effect a cure. The cylinder did not appear to have been starved of oil, and I had even removed the baffle plate. I then simply flooded the machine with oil, and was surprised to find my lost compression had come back. I tried the same experiment with an almost new model of the same make with the same result. The radical cure seems to be to fit a special oil inlet to the front cylinder. I may also mention that a liberal mixture of oil with petrol produced a marvellous effect until the carburetter showed signs of choking. I see that the makers are fitting the extra oil inlet on the 1916 model.—J.D.



A MOTOR CYCLIST AIRMAN. Pilot J. Alcock, R.N., and his overhead valve T.T. Douglas. He is well known in the aviation world, and in the famous London-Manchester-London flight he finished third on a Maurice Farman (Sunbeam engined) plane.

EXPERIENCES WANTED.

Readers desirous of obtaining the experience of others with various motor cycles or accessories must enclose a stamped addressed envelope in which the replies may be forwarded. Answers to the queries should be addressed c/o The Editor.

"J.M.D." (Ireland).—2½ h.p. O.K. Junior. Consumption, speed, hill-climbing, ease of starting, and reliability.

"P.D." (France).—3½ h.p. four-speed A.B.C. and sidecar. Reliability and efficiency.

"M.W.W." (Bromborough).—5-6 h.p. Bat and A.J.S., 1916 models. Speed, reliability, petrol consumption, hill-climbing, ease of control in traffic, and efficiency of mudguards.

"E.A." (Birmingham).—1915 Royal Enfield combination with Lucas electric lighting set. Reliability, durability, consumption, and advice for running and keeping outfit in good order.

"W.E.J." (South Wales).—3½ h.p. three-speed Brough for sidecar work. Hill-climbing, efficiency, ease of starting, silence, slow running, and reliability.

Under a spreading Chestnut tree
A mournful Cyclist stands;
A very "fed up" man is he,
With black and greasy hands;
For his troubles with the engine parts
Seem endless as the sands.

And children coming home from
A dozen strong or more; [School
Just love to get between his legs,
They want to "hear it roar."
He knows alas that burning sparks
Will fly from plugs no more.

Toiling—grousing—sorrowing,
One thing in life he knows;
Next morn will see a task begun:
To Godfrey's shop he goes
And buys a Power Plus INDIAN
Before the evening's close.

Week in, week out, from morn till
You can hear his engine roar, [night
You can see him swing his trusty bike
At speed up one in four—
And the Village Blacksmith died
with fright
As he stood at his smithy door.

We are more than sorry that the exigencies of rhyme compel us to deprive the Village Blacksmith of the night's repose awarded him by the gentle Longfellow long before the advent of the Power Plus Indian. We are sure that the Village Blacksmiths of to-day (if there are any left) will be proof against the phenomenal speed of the Power Plus Indian flashing past their smithy doors; especially when they learn that it is just as easy to ride this wonderful machine with "measured heat and slow" as it is to attain a speed which it would be unwise to mention.

Godfreys.

The **Power Plus Indian**

is the finest motor cycle yet offered to the Motor Cycling Public.

Christmas, 1915.

ONCE more, but we sincerely hope for the last time, the usual Christmas greetings seem somewhat out of place. The time-honoured wish of a Merry Christmas is an empty one when addressed to those whose nearest and dearest are in places of danger, or to those who are mourning the loss of friends and relations. Still a cheerful spirit is to be at all times commended; our country has weathered many a storm, and will do so again, and through it all has been known as Merry England, as Sir Walter Scott bears witness in the following lines from "Marmion":

"England was Merry England, when
Old Christmas brought his sports again.
'Twas Christmas broached the mightiest ale,
'Twas Christmas told the merriest tale;
A Christmas gambol oft could cheer
The poor man's heart through half the year."

The Lighting Regulations.

JUDGING from what we hear of the new rules for regulating the power, *i.e.*, the light-giving properties, of motor cycle head lamps, we incline to the opinion that the authorities are only making confusion worse confounded. They seem to have assumed that all motor cycle head lamps are equal in size and power, and, therefore, all that is needed is a uniform method of cutting off the light in the prescribed districts. This assumption is, of course, entirely fallacious; head lamps differ almost, if not quite, as much as the motor cycles themselves, and a general rule for keeping down the speed by attaching a 56 lb. weight to the tail would be just about as sensible.

What is wanted is a uniform beam of light, not a uniform screen, and it should, in our opinion, be left to the rider to reduce his light in any way most convenient to himself, provided that the reduction be satisfactory. It would be a simple matter to submit his reduced light to the chief of police in any of the special districts and get from him a certificate that it was satisfactory. This certificate should pass him freely in anyone of the districts, provided that he could prove that his lamp had not been tampered with and the light increased. It is obviously absurd to produce a powerful light simply to hide it under a bushel as it were, and if the proposed obscuring disc, with its shilling-sized holes, is to become compulsory, none but a powerful light will be of any use at all. Several excellent suggestions for reducing the light and at the same time the expense—another desirable object in these days of enforced economy—have appeared recently in these pages, and those who have the framing of official regulations would do well to consider some of these before adopting drastic rules which are suitable only in some cases.

Another absurdity is shown in the treatment of what are called swivelling head lamps; these are really nothing of the sort: they are simply adjustable, and many of them cannot be moved without the help of a spanner. In the unlikely event of a motor cyclist wishing to signal to the enemy, he could take his lamp bodily from his machine—the work of a moment only—and hold it in his hand. The rule, therefore, is of no use, but is only an annoyance, for in the case of a foggy night it is a real advantage to be able to throw the beam more down on to the road instead of keeping the rays horizontal. Such regulations defeat their own ends by making it more difficult than it should be for loyal motor cyclists to comply with the law of the land.

While we are upon the subject of lights on vehicles, it may not be out of place to suggest to the police that some notice should be taken of that very real danger on country roads, the covered van or trap whose only light is a stable lantern throwing a white light all round and held in the left hand of the man who sits beside the driver. This only dazzles the eyes of the unfortunate behind, who, supposing that he is meeting another vehicle, keeps to the left, and, his own light being reduced, is lucky if he finds out his mistake in time to avoid an accident.

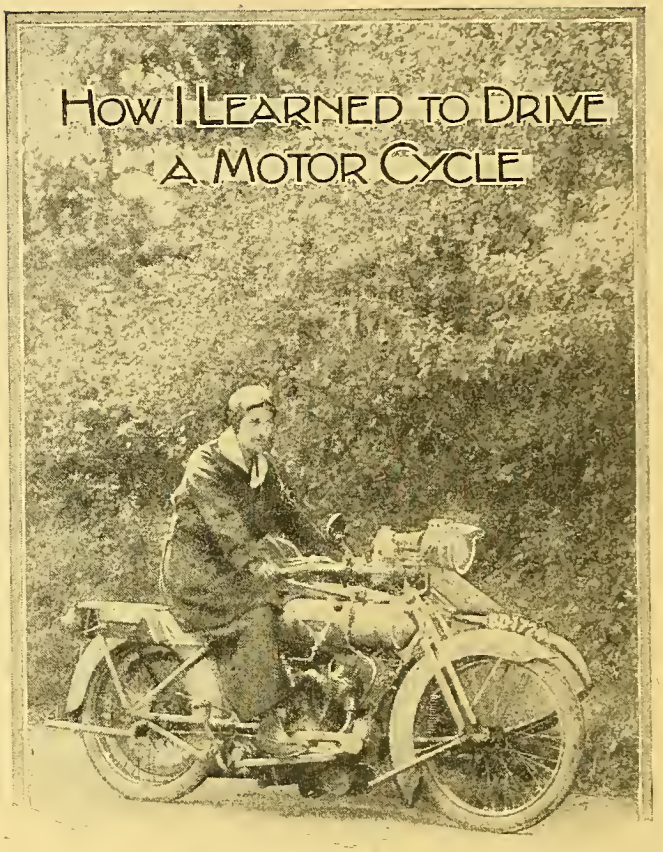
How I Learned to Drive a Motor Cycle



The author on a 6 h.p. Bat sidecar outfit.

I MUST first of all tell you that I have a husband, and, of course, he always lets me have what I want, but we nearly fell out over the new motor cycle and sidecar he bought. It is a lovely machine, all grey and silver, and he simply revelled in the mechanism, and only seemed really happy when he was "tuning it up" as he called it—whatever that wonderful process may be—anyway, he made himself fearfully greasy, but the result was worth it, for the speed was increased to 60 m.p.h., and my husband, Ted, assured me the petrol consumption was reduced as well, but whether that was to salve his conscience on the score of economy I don't know.

Now, I ask you, don't you think you would get tired of just riding in the sidecar? even though it is comfortable and cosy, and rides far better and more easily than the light car we had previously. So I coaxed and coaxed, and at last I was allowed to drive. I had often driven light cars, but had never been on a motor bicycle before, so you may imagine the delight with which I mounted the saddle for a trial trip. The road was open and clear, with very little traffic, and, as Ted pointed out, it had "soft sides," this being a warning that if I did anything wrong I should do less damage on a soft grass bank than by driving through a barbed wire or iron railing or into a brick wall. Horrid man! Just as if I should have done such a silly thing. Anyway, the engine was started and low gear engaged and away we went, Ted on the carrier telling me the uses of the different levers, while I endeavoured to keep the outfit on the road. A few hundred yards on low speed—and that must have been agony for any experienced driver—and I had gained sufficient confidence and understood how to use the levers well enough to change into second speed, which was kept in for another few hundred yards, and then I was permitted to change into "top." Then and not till then did I realise the delights of my mount. How my fingers itched to open out the throttle, but no! I must first learn to drive slowly and to keep the machine straight. Somehow or other the sides of the road would keep turning and twisting until the proper knack of steering was learnt; and then came the trial, I set my teeth, glared ahead with a fearful stare (I know I must have looked a fright), and with a great sigh realised the danger was passed. Don't be alarmed, it was not a Zeppelin bomb, or a mouse, or anything like that—no! but I had passed the first cart without hitting it.

Ted said the strain of it was too great for him, and he must sit in the sidecar and smoke his old pipe, and for once I made no demur. Then I found he had played a nice little joke on me, for, of course, I had stopped so that he could mount the sidecar, and foolishly I had also stopped the engine. However, the "kick" starter would start the engine again, I was told, but when I tried it I could not move it; then the fact that the engine was in gear was forced upon me, so I learnt one other lesson. Then a few futile attempts, and Ted, complacently smoking, informed me the "air lever" was wide open and I was initiated into the mysteries of "tap twiddling," and sure enough, on the first push the engine started. Of course, it was just like Ted to sit there and look on all the time, but, any way, I know how to work it properly now, and learnt in that way quicker than in any other.

Confidence at Last.

Up into the saddle again and off we went; in my enthusiasm while changing gear I nearly went into the hedge, but "once bit twice shy," that one scare was enough; now I never look at the gear lever when changing speeds. However, top gear was safely engaged and away we went in real earnest, not too fast, of course, but the magic of the machine was now in my blood, and I could hear the call of the road in my ears. The least touch to the throttle and the big "Bat" responded just like a horse, and we were speeding away westward to the counties of gladsome sunshine and luxurious greens. The steady beat of the engine sang a song of freedom and careless power to me—away, away, away, and on we went, uphill, down hill, speeding along on the level, somehow it all came to me at once, that here was the real thing. It seemed to have a vital force beneath me, no mere mass of machinery, but a living thing, pulsing, vibrant, and full of life.

Later on, when we pulled up for lunch, Ted said in his usual slow way, "not so bad," but with sparkling eyes and cheeks aglow, I answered, "It's grand! It's the real thing, why didn't we sell the car years before and have a motor cycle? You will buy me one all of my own, won't you?" Do you think he will?

LADY BEATRICE.

By Ixion

Thick Mud.

I have been doing some lanework in the recent wet weather, and I wonder what advice some unfortunate county surveyor, or other daily mudplugger, would give me on the subject, for I had a most miserable time. I can hold my own with most men when the main roads are slippery or heavy, but the six inches of coagulated sludge in these twisty lanes absolutely beat me. I tried taking them slowly, and before long my machine would slide into a rut perhaps 6in. deep and nothing would get it out; one either stopped and made a fresh start on the crown of the road or tried to steer straight until the footrests began to catch on the sides of the rut. Then I tried charging the abominable surfaces at 25-30 m.p.h., which has always been my pet recipe for stones and other brands of unusually formidable going; but whether I am getting old and nervous or whether my wrists have lost their cunning, I found it impossible to hold the steering straight, and, after a heart-chilling series of leaps and bounds and bumps and skids, I usually settled down to a slower pace before I had covered more than 200 or 300 yards at the faster pace. My machine was certainly too big and heavy for the job; I must try a baby two-stroke over the same route when another opportunity occurs and see if it is more manageable.

Dry Battery Lighting for Two-strokes.

I have made further researches into the question of dry battery lighting outfits for baby two-strokes, and have at last pitched upon a set which strikes me as about the lightest and cheapest likely to give satisfaction. In construction the set is hardly too heavy for a push bicycle, as it scales but 8 lb. 9 oz. all told, of which 6 lb. 14 oz. constitutes the weight of the two batteries, including their metal cases. The cost of the various items is as follows: Head lamp, complete with switch, wiring, and bulb, 13s. 6d.; head lamp battery, 8s. 2d.; metal carrying case for same (hooks on to side tube of carrier, with patent clip to lock to carrier strut), 6s. 6d.; metal fitment, containing red rear lamp, small dry battery, and switch, clipping to chain stays, 7s. 6d.; spare bulb (fits either lamp) in wooden case, 11d.; total, £1 18s. 7d. The light given by the outfit is all one could require for pottering at medium pace on a light machine, and the strength of the various items appears adequate. The switch of the tail lamp is ingeniously concealed from meddlesome urchins, as it is operated by twisting the bulb holder. I will report later on the life of the batteries, but judging from my friends' experiences, I cannot expect more than about twenty hours' lighting, the cost of which is 10s. 8d. (8s. 2d. for head lamp battery, and 2s. 6d. for tail lamp battery). This is expensive on prolonged rides, but its cleanliness and convenience for intermittent short work are obvious, and carbide is the reverse of cheap when lamps are employed for brief spins. Some riders inform me that I shall get astonishingly long life from the big head lamp battery, but I reserve judgment, as a friend used up a similar set in a winter "48" hours trial: the makers only promise twenty hours from the small tail lamp cells.

The Editor and Staff of "The Motor Cycle" wish all readers at home and abroad A HAPPY CHRISTMAS. May a speedy victory crown our arms!

The Next A.C.U. Trial.

I know this cross-heading alludes to events which may be far distant, but it is dictated by an interesting suggestion. An inveterate speed merchant remarked to me last week that there are only three motor bicycles in the world. On being challenged he admitted that "any old 'bus" would serve the turn of an owner who is content to potter along at 25 m.p.h. average speed. The speaker habitually averages 30-35 m.p.h. on his long trips and does his 20,000 miles every year. On these terms the ordinary machine soon crumples up. It sheds

Occasional Comments.—

its pretty fittings, wears out its engine and gear box bearings, and, possibly, even suffers from serious structural fractures. "I take no notice of six days trials!" he remarked haughtily. "Any machine can get through them if it is lucky with its tyres." There is a modicum of truth in his remarks. The motor cycle butcher is the man who tests quality down to rock bottom, and learns to sift the wheat from the chaff—a function which A.C.U. Trials have lately ceased to fulfil. But reliability trials on the public roads have already been stiffened up to the last notch. The police will not allow us to pile on the average speed. The trade will not allow us to prolong the distance or the time. Nature forbids us to accentuate the hill tests, and, if we could unearth worse hills than we have yet employed, a general lowering of gear ratios would promptly cancel our efforts. We are in a dilemma. Shall we continue after the war is over to organise trials which notoriously fail to differentiate between first-class and second-class machines, which perhaps even misrepresent facts so badly as to place third-rate crocks on an apparent level with the best machines in the world? Or shall we hold our next big trial on Brooklands at a vastly increased speed schedule and relieve the monotony, from the driver's standpoint, by employing relays of riders? I returned home from the two last A.C.U. Trials in profound disappointment. Freak hills and the fortuitous incidence of tyre troubles under a close time schedule had doubled or trebled the element of luck, whilst the tests provided were so unexacting that merit had a comparatively poor opportunity of distinguishing itself.

The Cost of Combination Covers.

A recent paragraph of mine might be taken to mean that combination covers were normally more expensive than steel-studded types. Needless to say, this implication is unjustified. "All-rubber" treads, whether plain, scolloped, or studded, are cheaper to produce than compound treads, embodying leather or metal; but the combination cover is, if anything, a shade cheaper, as a rule, than a full steel-studded tread. When I alluded to the cost of combination treads as perhaps exercising some deterrent effect on the huge popularity to which their intrinsic merits certainly entitle them, I was specially thinking of motor cycles and light cars, both of which can be regarded as fairly safe on most kinds of grease when "all-rubber" treads are employed. On the other hand, heavier cars are generally thought to need greater insurance against skids than any all-rubber tread affords; in this case, the question of cost hardly applies, as the combination tread is as cheap as, or cheaper than, the full steel-studded tread, and is an efficient non-skid on ice or greasy macadam or asphalt, where the full steel-studded cover is not particularly satisfactory.

Chaos in Back Wheel Accessibility.

If you buy a modern motor cycle, you can absolutely rely on getting a good engine, a reliable magneto, and a tolerable carburetter. The only gamble is whether it will take seconds or hours to take out the back wheel. Odd, isn't it? When one maker gets his teeth deep into a sound idea, the others usually copy his lead like sheep; but there is some sort of Hague Convention about back wheels, exempting them from plagiarism. Two or three firms adopt knock-out spindles, or miraculous axles which spit the back wheel into the road if a novice ejaculates "Sesame!" leaving the brakes and chain cases adhering to the rear frame. *Per contra*, the next machine you buy is obviously modelled on those wire puzzles which are found in the best brand of Christmas cracker—you know the sort of thing: an anchor, two bracelets, three keys, four corkscrews, and several miles of Hun barbed entanglements, which dissolve mysteriously if you give them the proper sort of shake, but keep grandfather quiet in his corner chair till the New Year. For this sort of machine you want the temper of an archangel, the leisure of twenty years' penal servitude, a tin opener, a crowbar, and sixty assorted wrenches should you desire to remove the back wheel and fit a new cover. I speak feelingly; let me add that it was raining; the thermometer about zero; no railway arch or tavern within parasangs; and She was waiting on the gate eight miles away!

What a Spring Frame can do!

There is little doing in the motor cycle world at present, apart from catering for the Army's needs, but such glimpses as one can obtain of the hopes designers are cherishing for post-war activities suggest that the spring frame must boom soon after the Peace of Potsdam. I wonder if the rider who glibly murmurs that "we want better springing" realises what a good spring frame can do. To quote an actual example, I took a trial some weeks ago of a certain machine which was efficiently sprung fore and aft without any sacrifice of lateral stability. Its front wheel could rise 4in. from the datum line of the road without jerking the rider or saddle a millimetre upwards, and the back wheel could jump no less than 5½in. upwards whilst leaving the rider's level unaffected. On such a mount a level crossing can be taken at speed without its presence being felt at all. The machine can be ridden at 30 m.p.h. over really bad pot-holes without the wheels ever leaving the road at all. It can be bucked at right angles over a row of planks measuring 3in. × 3in. square without the least risk of losing steering control and without the rider quitting the saddle or his feet being thrown off the rests, though the extremely vertical and angular nature of such artificial obstacles renders their presence under the wheels perceptible. Trials men will recall the horrible character of the road from Applecross to Tornapress in the Highlands. In the last Scottish Trials many a man dismounted for two or three rests in the *descents* of the two long hills on this pass simply to seek a moment's ease from the agony of aching wrists and jarred teeth and jawbones; another man bit the mouthpiece of his pipe clean through over one of the bumps. The ascent of these twin hills of loathsome memory would not feel as smooth as newly rolled asphalt with the spring frame in question; but if it were ridden up those rugged roads and naked rock reefs, the rider would not wish to dismount for a rest, and his body movements during the ascent would remind one rather of skipping on a spring mattress than of being rolled down stone steps in a barrel. The spring frame has got to come; and the designer who ignores its possibilities will get left when peace returns.

The Elopement of Araminta.

By ANGELINA SIMPKINS (Author of "Lilacs and Love," "Burning Kisses," "A True Hero," etc.)

IT was a dark and stormy night. Overhead the chill moon was casting down its yellow rays. Far away in the dim west a purple cloud heralded the coming dawn.

In the bushes by the roadside a branch snapped. Lady Araminta MacHaggis, only daughter of the proud Earl of Ettrick, stepped out into the moonlight. Clad daintily in a chiffon veil, a purple parasol to match the sunrise, and a pair of high-heeled shoes, she might have sat for a cubist painting. Her golden hair and blue eyes gleamed brilliantly, and

"And a fledgling sparrow fell from its nest."

"The parson is waiting at Aberdeen."

a fledgling sparrow fell from its nest.

The horn of a motor cycle sounded far down the road. With a roar and a whirr of dancing wheels a vast two-stroke racing motor bicycle sprang along the road like a giant untamed, and stopped dead as the rider applied the brakes. Roland St. Clair leapt from the saddle and sped to meet the waiting maiden. He took no notice of her unusual attire, but cried, "My darling! You are here o meet me! Does your father know you are gone?"

"No, Roland, all is well."

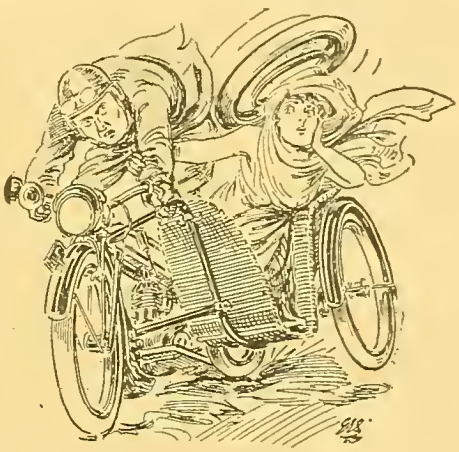
"The parson is waiting at Aberdeen, a hundred iles away. Come, my dar-ing, our mount is ready."

He caressed the engine of is beloved Minerva. It burnt is fingers, but he made no ign.

A trailer had been attached y the side, and into this raminta climbed. Roland ouched a lever, and the great wo-stroke sprang into life, its alves racing up and down as f they knew what a duty was heirs that day. He advanced he ignition of the magneto, nd they moved off down the oad, gathering speed. Soon e changed the gear and let out the clutch, and in a sudden dash the bicycle nearly went through the hedge. With a magnificent effort of driving Roland turned the corner (he had once taken the first prize at Brooklands), and they sped off down the broad high road at nearly sixty miles an hour. Lady Araminta looked back. "Oh, Roland!" she gasped, "there is father on his new twin Levis just behind!"

Roland looked back, and just missed the hedge. "You are right," he said, "but my old Minerva holds the world's record for speed, and we will beat him yet."

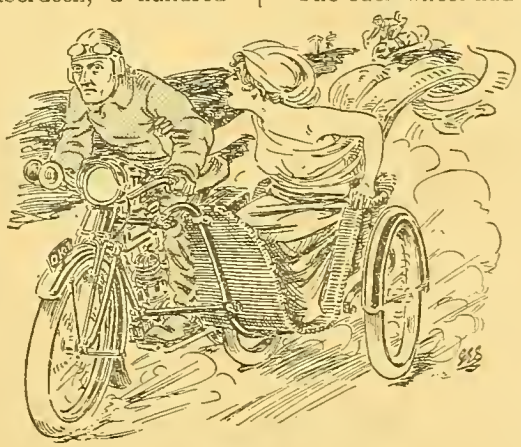
With set teeth he bent again to his task. He turned on more petrol, and did something to the accumu-



"Something was terribly wrong."

lator with a penknife. Slowly they drew ahead. At the end of half-an-hour the Levis was several miles behind, in spite of its two engines.

The path of love is never smooth. Roland suddenly felt a great bump below him, which he put down to the uneven road. In a few seconds, however, he realised that something was terribly wrong, and, glancing down, he saw his suspicion confirmed. The back wheel had fallen off, and was lying some distance down the road. He ran back and fetched it; but time had been wasted, and as they started off again the panting of the Levis could be heard drawing nearer in the distance. But scarcely had the lovers got up full speed again, when, in turning a sharp hairpin corner, the indiarubber belt broke in two.



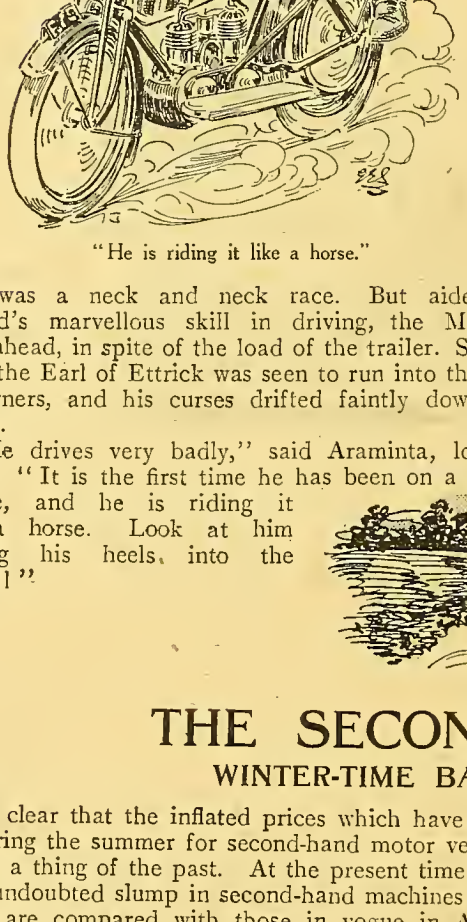
"There is father just behind!"

Roland did not waste a moment. He seized the chiffon veil and tied it tightly round the wheels. "I would rather be drawn by a veil of yours, darling," he panted, "than the best John Bull deep drive that was ever made."

The Elopement of Araminta.—

The Levis was now only a few yards away, and they could hear the Earl of Ettrick bawling loudly that he would have the law on them. "How I wish it would break down!" sighed Lady Araminta.

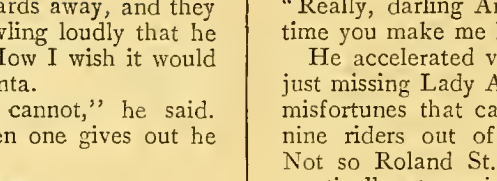
Roland shook his head. "It cannot," he said. "There are two engines, and when one gives out he can use the other."



"He is riding it like a horse."

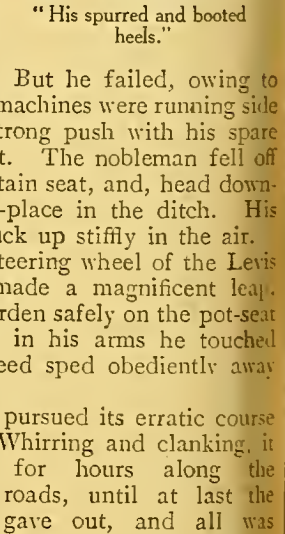
It was a neck and neck race. But aided by Roland's marvellous skill in driving, the Minerva drew ahead, in spite of the load of the trailer. Several times the Earl of Ettrick was seen to run into the wall at corners, and his curses drifted faintly down the breeze.

"He drives very badly," said Araminta, looking back. "It is the first time he has been on a motor bicycle, and he is riding it like a horse. Look at him digging his heels into the engine!"



Roland looked, and very nearly ran into a gatepost. "Really, darling Araminta," he said firmly, "the next time you make me look round it will mean a funeral."

He accelerated violently, and the cylinder blew off, just missing Lady Araminta. This is one of the worst misfortunes that can happen to a motor bicycle, and nine riders out of ten would have given up hope. Not so Roland St. Clair. As the engine raced on erratically, staggering under the faulty compression, he leant over and snatched his loved one from the trailer into his arms. "My angel," he breathed, gazing into her clear blue eyes, "for thee I will dare anything!"



"His spurred and booted heels."

Swiftly the Levis drew abreast with the tottering two-stroke, and the Earl of Ettrick grinned spitefully, and attempted to hiss through his clenched teeth. But he failed, owing to lack of practice. As the two machines were running side by side, Roland gave one strong push with his spare hand on the Earl's waistcoat. The nobleman fell off at once from his rather uncertain seat, and, head downwards, found a soft resting-place in the ditch. His spurred and booted heels stuck up stiffly in the air.

Roland had grasped the steering wheel of the Levis motor cycle, and now he made a magnificent leap and landed with his living burden safely on the pot-seat saddle. With his Araminta in his arms he touched the levers, and the swift steed sped obediently away to distant Aberdeen.

But the deserted Minerva pursued its erratic course with no hand to guide it. Whirring and clanking, it reeled for hours along the lonely roads, until at last the petrol gave out, and all was still.

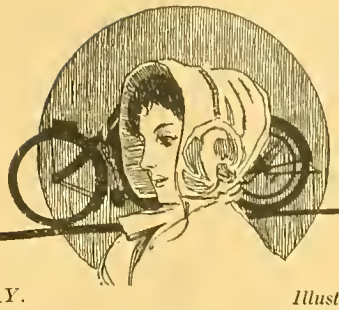
THE SECOND-HAND MARKET.

WINTER-TIME BARGAINS TO BE OBTAINED.

IT is clear that the inflated prices which have ruled during the summer for second-hand motor vehicles are a thing of the past. At the present time there is an undoubted slump in second-hand machines when prices are compared with those in vogue in August and September, and the present figures more nearly approach the normal, *i.e.*, peace time, value of motor cars and cycles. Consequently, now is a chance for the buyer who is able to anticipate his wants in the spring, as it is evident that the sudden reaction in the second-hand market is due primarily to two causes, viz., the advent of winter, which usually has a damping effect in more senses than one, and the new Recruiting Scheme. We feel confident that, with the arrival of spring, the prices will harden again appreciably, as they usually do, and may be increased more than usual in view of the comparatively small number of new machines which it is now possible for the manufacturers to produce. Therefore our advice to readers who may shortly be requiring a second-hand machine is to consider whether it would not be more advantageous for them to purchase now while prices are ruling so low. The highwater mark of August and September is past, and December seems to be touching the lowest level.

In times of peace December is always a bad month in which to sell, while March is probably the best time. This is due, of course, to the near approach of Easter, the first public holiday of the year, when many persons find that they cannot obtain quick delivery of new machines and so turn to the second-hand market.

BLUFF.



The Story of a Scrap of Paper.

By CHARLES MURRAY. Illustrated by OSWALD CUNNINGHAM.

"YAAS, sir, we're on time with everything, and all we want now is the formula."

The speaker was a man of about forty, with a big strong body and deep nasal voice. He drawled his remarks to his employer, John Gray, the sole proprietor of the Gray Motor Co., who, a few years previously, had appointed him general manager of the great business which held the premier position among motor cycle manufacturers in this country. At the commencement of the war the whole output of the works had been taken up by the British and Allied Governments, and day and night the factory had hummed with the busy forging, casting, welding, and assembling of "War Office models" and sidecar outfits complete with machine guns. Then came the call for high explosives, and most of the works had been monopolised for making munitions.

"Quite so," said Gray, "we must have the formula by to-morrow, but I have not yet made up my mind how to get it here."

"Why not let me go and fetch it?" asked the other in a casual tone.

"For the same reason that I don't go myself. We are both too well known in connection with this munition business. Well, I need not keep you any longer, Mr. Sleath. Oh! before you go, tell me—has young Bernard Russell been worrying any more about enlisting?"

"Why, yaas," replied the manager. "He's always shooting hot air about it, but I've told him repeatedly that no one can be spared from here. However, it seems to me a pity not to let him go. He's doing no good where he is."

"You never have much good to say for that young fellow," remarked Gray quietly. "However, I will talk to him about it myself."

Gray telephoned to the repair shop, and, as Sleath left the room, carelessly laid the receiver on the table in front of him.

A few minutes later a man, twenty-five years of age, knocked and entered the room. He did not look his height, which was well over six feet, for his figure was well proportioned, nor his age, his face being that of an honest schoolboy with bright eyes which sparkled as he spoke, and his untidy mop of brown hair was as unruly as that of any little fourth form rascal.

"I understand that, in spite of being a starred man, you are anxious to join the Army, Russell," said his Chief.

"Yes, sir, I am," he answered. "At least, it's not necessarily the Army, sir, but I want to be doing something really useful for the country. I would be glad to stay here if I were doing the right work, but Mr. Sleath has put me in the repair shop, where I can do nothing but tinker up private owners' machines, and I feel my training is worth something more than that, sir."

"So do I," said Gray, looking into the boy's earnest face. "Therefore I am going to give you a chance of serving your country to-day.

"England is about to make, from simple ingredients, a most powerful explosive, which experts believe will bring about the speedy collapse of our enemies. As these works are especially suitable for this particular service, we are to have the privilege of making the first lot of new shells for the use of the Allies' big guns."

Gray paused, and then asked, "Is your motor cycle in perfect order?"

"Yes, sir, I always keep it well tuned up."

"Good. I consider the road safer than rail for the expedition you are to make. You will ride to London at once, and go to the War Office. Ask for Major Everard Worsdell, saying that you come from Grays. Repeat these numbers to him—one, four, five, nine."

Gray had been toying with his telephone receiver, which he now replaced on the stand.

"I believe I have made a mistake in the numbers myself," he then said, turning over some papers. "Yes," I thought so. I had got the order wrong. It should be one, four, nine, five. Remember that."

He then gave Russell a few more directions.

"Does anyone know, sir, that I am going?" the latter asked.

"I have told no one, though Mr. Sleath may have guessed. Mention nothing to him or to anyone else. Slip out of the works and go. I shall expect you back at about nine o'clock this evening. Come straight to me here when you arrive. Here are a couple of pounds for meals, petrol, and anything else you may need on the road. Put this also in your pocket; it's loaded. Don't use it unless you are absolutely obliged to; but if you have to shoot, shoot straight."

The Ride to Town.

Russell was burning with excitement as he took the flight of stairs at one bound, and ran round into the shed, where all machines belonging to the staff were kept. He wheeled his own mount out into the yard, turned on the petrol, flooded the carburetter, and gave one, two, three quick kicks to the starter. No result. No shock when he held the plug terminal and kicked. Insulated wire all right. Magneto must be wrong. Who in thunder had been monkeying with his machine?

Bluff.—

He had no time to tinker about with a magneto, so he looked about him for another suitable mount. An almost new big twin with a luxurious sidecar caught his eye at once.

"Sleath's, by Jove. The very thing!" he said to himself. "Won't he be wild when he finds it gone."

It took him but a few seconds to detach the sidecar, and within a minute he had slipped out of the gate, and was quietly purring up the road. It was a bitterly cold day with a keen north-east wind, so he had wrapped himself up in the General Manager's thick ulster which had lain invitingly in the sidecar.

Russell decided to go by the main London Road and to return by a more circuitous route. Snow soon began to fall heavily, and the cold wind drove hard in his face, trying, as it seemed, to keep him away from London. However, both snow and wind met their master in the powerful machine which, divested of its usual burden, made light of all opposition, and responded gladly to the throttle which the rider opened more and more as he tore along over the rapidly whitening ground.

Russell was supremely happy. He was being recognised at last, and had now been entrusted with a mission of vital importance. Further, this mission was taking him just where he had been wanting to go for many months past. True, he would not have much spare time there, but he would be able to leave his, or rather Sleath's machine at Martin's Garage, and then he might catch a glimpse of, and perhaps a few words with, Mary Martin, who was working so hard for her father in place of the brother now somewhere in France.

Mary and he had been on terms of healthy friendship for years, but latterly he had felt awkward and tongue-tied in her presence. This time, though, he would speak out and tell her something that he had tried but been unable to frame in his letters.

Thus he thought as he sped along, covered with snow and ploughing through the thick white crust on the roads. He had been riding hard for nearly three hours, when the crystal surface became a greasy sludge, churned up by the traffic of a busy London suburb. Thoughts of skidding never came to him as he whirled round trams, between 'buses, and past streams of slow traffic. It was half past two when he wheeled his mud-bespattered machine into the large garage. There was Mary in a blue overall, running the show, and at the moment instructing a bullet-headed mechanic how to set the timing of a six-cylinder car.

She came forward with joy written all over her pretty face.

"She came forward with joy written all over her pretty face."

"Bernard!" she exclaimed as he seized her hand. "It is delightful to see you. How long are you going to stay in Town?"

"Only a few hours, I'm sorry to say, and I shall be engaged most of the time. I'm up on important business for the Governor, and must get back to Minford before nine o'clock this evening. Can you spare half an hour now? I'm famished and want some lunch. Come and have some with me, before I go on."

Mary could not leave the garage as she was in charge, but she sent out for a meal for him so that they might have a few words together when her duties would permit. She asked no questions; Bernard had said he was up on important business, and unless he volunteered more information, that was enough for her.

Refreshed, he decided to go on by taxi and to return as soon as possible, so that he might have a little more time with Mary. When he left she insisted on giving him a ticket for the machine. It was garaged with her, and "business is business, you know," she said.

At the War Office.

On alighting from the cab in Whitehall, Russell drew some change from his pocket and, with it, the garage ticket. He was selecting a coin to pay his fare when an obviously drunken man lurched against him, and sent the money spinning over the pavement. The man, muttering fuddled apologies, helped him collect the money and then hurried away. Russell did not notice until he was waiting in the vestibule of the War Office that he had lost the ticket. However, this did not worry him. He would have a joke with Mary about it when he returned for his machine. He had to wait some time and state his business to various officials before he was ushered into the presence of a tall, gaunt-looking officer, who riveted him with the eye of a hawk.

"From whom do you come?"

"Grays."

"Number, please."

"One, four, nine, five."

"Quite right, but you are not the first man who has been here about this. The other gave the order wrongly, and is now under arrest.

The Major then handed Russell a slip of blue paper with some unintelligible hieroglyphics on it.

"This is your despatch," he said. "You know of its importance, so I need not give you any warnings. In case you are being watched you had better leave the building by a side door."

He led Russell through a labyrinth of corridors and let him out through a small door into a side street.

Bluff.—

"Good luck to you, my boy," said the soldier, and the door was shut.

It was getting dusk when Russell reached Martin's Garage, where Mary met him with an anxious face.

"I hope I did right," she said, "in not letting him have the machine."

"He? Who? What machine?" he asked.

Mary then told him that during the afternoon a big man with an American accent had presented the garage ticket which she had previously given to Russell, and had demanded the motor cycle. As she would not part with it, the man had stormed at her, saying that the machine had been stolen, and that he would fetch the police. However, he had not yet returned with the arm of the law.

"Good Heavens, Sleath!" exclaimed Russell. "I always thought the man was a blackguard, but I never dreamed he was as bad as that. Well done, Mary, you did quite right. If our American friend is what I think, he won't seek the assistance of the police."

Russell decided to get away at once, as he was anxious to be well out of London before it got quite dark. He could have said a whole lot to Mary just then, but it must wait for another time. As he wheeled his machine from the garage he drew the scrap of blue paper from his pocket and slipped it into his saddle pillar. He looked up and saw that Mary was watching him. That did not matter, he thought, she was as safe as a church, but he did not notice that the occupant of a racing car which had just drawn up also had his eyes on him.

Hurrying Home.

A hasty good-bye, and he was off. It had stopped snowing some time previously, and a severe frost had set in. The roads were already hard, but the frozen lumps of mud and snow made riding difficult. However, he sped through the suburbs at a good pace, but it was dark before he reached the open country, and when he switched on his electric head and tail lamps he was still within the area where lights are restricted. He tied his handkerchief over the head lamp, but was suddenly pulled up short by a cry of "Stop!" A policeman was standing in his way. He dismounted.

"Licence, please."

"What's the trouble?" Russell asked.

"Your light is too bright and your engine is making a tremendous noise. You have no silencer, or else it has a hole in it."

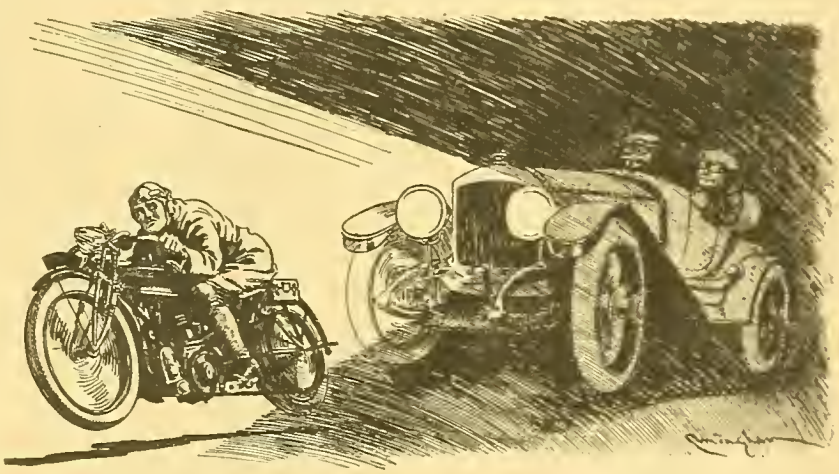
"Of course I have a silencer," said Russell. "And of course it has a hole in it. How do you think the exhaust gases would escape if it hadn't?"

"Then it's illegal," said the constable definitely and with a great air of knowledge. Just then the purr of another engine was heard, and round the bend of the road appeared the beam of another head light. The policeman swelled visibly with dignity. He was going to make a double haul. He shouted to this rider also to stop, but the engine had already ceased to fire before the command had been uttered. The second motor cycle glided silently up to the gentleman in blue.

"Licence, please," he said as before, but this time he seized the handle bars of the offending machine as if in fear that it would suddenly bound forward and escape him. The rider left the machine in the policeman's hands and ran up to Russell.

"Go on, Bernard, go on for all you are worth," said a girl's voice very quietly, but rapidly, and with a strong note of appeal. "A racing car is in pursuit, but I slipped by in the traffic to warn you."

Russell recognised Mary, and, instantly obeying her, lifted his exhaust and pushed off. After covering many a mile, he was careering along a straight road with a pine wood on either side, when suddenly a beam as from a searchlight behind him turned night into day and transformed the track into a glistening and brilliantly-lit tunnel. Russell did everything he could to get still more speed from his mount, but although his pace was terrific, the thunder of the huge car drew closer and closer. It was only just behind him now,



"The thunder of the huge car drew closer and closer."

and Russell instinctively drew over to the left, to allow the overtaking vehicle to pass. He then shut his throttle and put on his brakes, so that the car might shoot ahead, and not be able to stop and turn round before he had found some means of escape. The car did not keep straight on; it also drew over to the left. Russell heard a grinding crash, felt himself flying through space amidst a firmament of stars, and then all was dark.

* * * * * *

Presently Russell came to and was still wondering what to do when the lights of two cars appeared in the distance, advancing at a good pace. He sprang into the road, shouted and waved to the drivers to stop. They drew up, and Russell immediately recognised Major Worsdell with another man in the first car. He explained his position in a few words, jumped into the car, and was soon making for Minford at all speed.

The Capture.

When they were within a mile of Minford, lamps were switched off and they proceeded very cautiously. A couple of hundred yards from Gray's works they

Bluff.—

stopped. A burly sergeant and seven men got out of the second car, and the party proceeded silently towards the works. There stood the racing car under the shadow of some trees. Two soldiers slipped away from the others and took possession of this. The rest crept into the yard, unnoticed by a rapidly moving figure which they saw busily attaching wires to what looked like several round pegs. He was working towards them, standing more pegs upright in the snow and connecting them with wire.

The sergeant moved noiselessly forward, and before the man could cry out had whipped a scarf over his head and gagged him. Two more of the soldiers seized the victim and carried him outside.

The gentleman in civilian clothes, who had travelled in Major Worsdell's car, spoke for the first time.

"Just as I thought," he said. "Roman candles ignited by an electric current, a most useful guide to a target in darkness. Now for the head of this gang."

They walked to the office entrance of the building. The door was on the latch, and they heard voices in the room above. After a whispered consultation on the stairs it was agreed that Russell should take his despatch to his chief, and the others would wait on the landing outside.

He entered the room without knocking. Gray, seated at his desk, looked up and smiled. Sleath, as bold as brass, was lolling back in a chair, hands in pockets, and with his back to the door.

"Well, Russell," said Gray, "I am glad to see you back in good time."

Sleath started, but quickly controlled his astonishment. Gray took no notice of him.

"Have you the formula?" he said to Russell.

"Yes, sir," the latter replied.

At that moment Major Worsdell, his companion, the sergeant, and one soldier entered the room.

"Baron von Schleigel," said the gentleman in mufti, deftly slipping a pair of handcuffs on Sleath's wrists, "I hold a warrant for your arrest on the charge of espionage."

He had not finished speaking before a droning noise attracted the attention of all. It grew rapidly louder and louder until it resembled the roar of an express train overhead.

"Curse the lot of you," cried Sleath. "Do you hear that? That is one of our great Zeppelins, which will bring your devilish country to her knees. He is an hour too early, but he shall blow all of us and these works of hell into little bits to-night."

"I'm afraid you are to be disappointed," said the man who had arrested him. "Your friend below, who was to have given the signal, is otherwise engaged just now, and will not be able to give his little firework display."

Snarling an oath, Sleath bounded to the window and with his two manacled hands was about to seize the blind. A shot rang out and with a howl of pain the German-American rolled on the floor.

"Good shot, lad," said Major Worsdell to Russell. "Got him clean through the wrists. Take the wretch away," he added to the sergeant, who, with the private, dragged the spy bellowing and cursing from the room.

The noise in the air had grown faint and was now but a droning in the distance.

Gray stood up and shook Russell by the hand.

"My dear boy," he said. "You have proved yourself worthy of much better work than you have ever had the chance of doing, and I am afraid what I am going to tell you now will cause you some pain. This scrap of paper for which you have done so much is of no use whatever. It means nothing."

"His Majesty never fails to recognise distinguished conduct such as you have shown to-day."

"No, Russell," Gray continued, "the War Office does not send important despatches in that way. The formula we require has been in my *head* for a week past. This scrap of paper was all bluff, but it was bluff with an important object, which with your splendid help we have attained. Three of the most dangerous German spies in this country have now been caught red-handed. One of them was captured at the War Office to-day by a simple trick. You may remember that I corrected the numbers I first gave you this morning. When I said them in the wrong order my telephone receiver was in my hand. Sleath, I guessed, was listening. He informed a confederate who fell into the trap. You have just assisted in the capture of the other two. Now I can no longer keep you wasting your time in my repair shop, and Sir Edward Naughton here has other work for you to do."

The Reward.

"By Jove!" broke in Major Worsdell, "I never introduced you. This is Sir Edward, who is the Chief Officer of the Secret Service Police of Great Britain."

Sir Edward put his hands on Russell's shoulders.

"I have recently been looking," he said, "for a live young man with some brains, plenty of muscle, and a whole lot of nerve. I think I have found him this time. There will be plenty of work for you in the service of your country now, and I may mention that His Majesty never fails to recognise *distinguished conduct* such as you have shown to-day."

MILITARY NOTES.

THE KING HONOURS THE M.M.G.S. A SERVICES HILL-CLIMB.

Officers, N.C.O.'s, and men of the No. 18 Battery, Motor Machine Gun Section.

HONOUR FOR M.M.G.S. OFFICERS.

DURING his last visit to his troops in France, His Majesty the King inspected the No. 16 Battery, Motor Machine Gun Section, which with many other batteries is now on active service on the Western front. Major Thackwell, O.C., commanding the No. 16 Battery, had the honour of showing His Majesty round, and the latter was much impressed by the construction of the gun

Lieut. C. Wickham-Conduit, of the No. 16 Battery, M.M.G.S.

emplacements and trenches. Lieut. G. Wickham-Conduit was responsible for the selection and manufacture of the emplacements, and His Majesty congratulated him upon them.

Another matter which interested the King during his visit to the No. 16 Battery was a magnificent dug-out, for which Lieut. Wickham-Conduit is also responsible. It is a very luxurious affair, and is called the "Hotel Cecil."

NEWS OF SERGT. E. J. BASS.

WE recently heard from Sergeant E. J. Bass, the well-known official of the Essex M.C. He writes: "Just a line to tell you I am still quite safe, and have had a change since I wrote you last, as I am now not with ambulances, but attached to a siege battery. As road sergeant, I use a Triumph motor cycle, and find it stands up very well to the work."

A SERVICES HILL-CLIMB.

AN event of a sporting nature, devoid of all trade interest, was the hill-climb for Service men, held in the Isle of Wight on December 5th. The leading light in the enterprise was Lieut. C. E. Dalton, and the competition was open to officers, N.C.O.'s, and men of both Services.

The hill selected was 890 yards long, with a very sharp corner near the starting point. The gradient was not very severe, and the surface was in fair condition. Unfortunately, it rained so heavily that it was only possible to run off four of the seven classes, and the times varied to a considerable extent, for which the rain may also be held partly responsible. Timing was done by an electric cable.

An important regulation was that forbidding the use of Government machines. It is a pity that the bad weather prevented some entrants from turning up.

MOTOR CYCLIST AVIATOR.

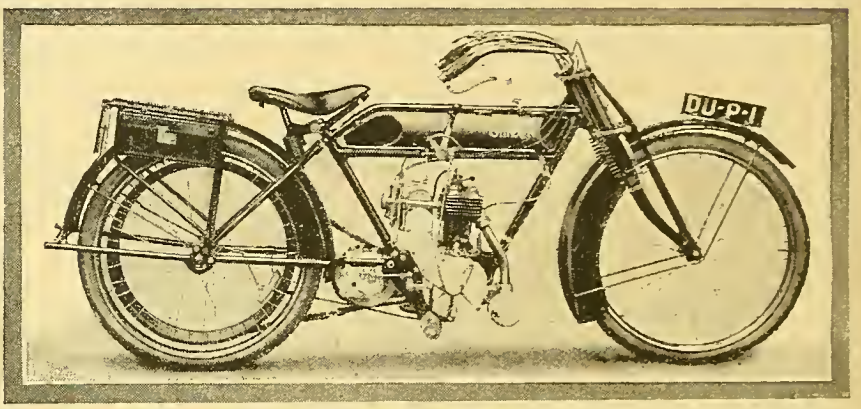
FLIGHT SUB-LIEUT. C. W. GRAHAM, R.N.A.S., the pilot who sank a German seaplane off the Belgian coast early last week, was at one time engaged with the Triumph Co. at Coventry, and at the outbreak of war he was with the Bosch Co. at Stuttgart. He managed to get away from Germany soon after the declaration of war, and his adventures in trying to smuggle his Triumph along with his personal luggage *via* Switzerland were recounted in *The Motor Cycle* of August 27th, 1914.

Mr. Graham is well known in Coventry, and is a member of the Coventry and Warwickshire M.C. He is the son of Mr. C. Graham, of Barnes, a director of Brown and Barlow, Ltd. Our readers will join us in offering him our congratulations on his achievements, and wishing him the best of fortune in the future.

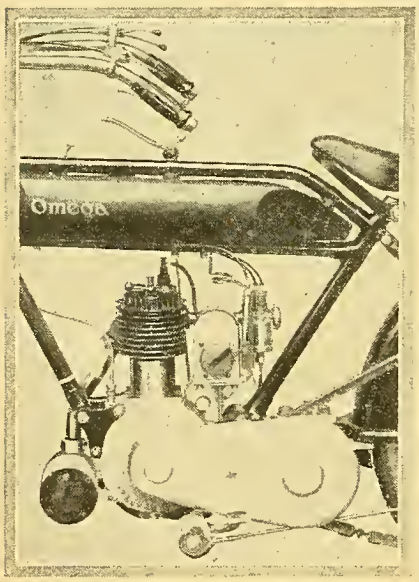
OMEGAS FOR 1916.

A NEW FOUR-STROKE LIGHTWEIGHT MODEL.

IT was recently pointed out in *The Motor Cycle* that quite a number of firms who have been manufacturing two-stroke lightweights were now turning their attention to four-stroke models, either instead of, or in addition to, the two-strokes. Among the several firms to do this are Messrs. W. J. Green, Ltd., of Coventry, the manufacturers of the Omega lightweight. This firm has specialised in two-strokes all along, but for the coming year it is placing an additional model on the market fitted with a 2½ h.p. J.A.P. engine of 70×76 mm. bore and stroke, giving a capacity of 292 c.c. An E.I.C. magneto is situated behind the engine, above which is fitted an Amac carburetter. The frame of the new model is exactly the same as that used on the two-stroke, the only difference being that the front down tube, instead of being forked, has a special lug to accommodate the J.A.P. engine. The tubing used is of special heavy gauge to enable a light sidecar to be attached without fear of over-straining the frame. A two-speed countershaft gear is fitted, operated by a strong gate type lever. The drive is, of course, by chain and belt, the chain being enclosed in a most substantial yet neat cast aluminium case, which is far better than the usual stamped sheet metal type. Druid spring forks, 26×2in. wheels, wide mudguards with side valances back and front, strong tubular carrier, at the side of which is fitted a large toolbag, hand-operated front brake and heel-operated back, and large Brooks saddle complete the specification. The general finish is excellent.



The latest four-stroke lightweight—the new 2½ h.p. Omega, which has a two-speed countershaft gear and the usual chain and belt transmission.



Power plant of the new four-stroke lightweight Omega. The engine is a 2½ h.p. 292 c.c. J.A.P. The neat chain cover will be noted.

The tank as fitted to the two-stroke is still retained; its rounded edges, tapered ends, and finish in black with red panels give it a distinctive appearance. Enots quickly detachable filler caps are used.

We were recently favoured with an opportunity of trying the new four-stroke Omega on the road, and we were much struck by the handiness and easy running of the little machine. The roads were in a particularly greasy and muddy state after the recent thaw, so we had plenty of opportunity of testing its stability, which we found excellent, and which was probably considerably helped by the wide bars, which gave a most comfortable riding position. The speed on the level was very satisfactory, while a mere crawl was possible for negotiating traffic.

The Two-stroke Model.

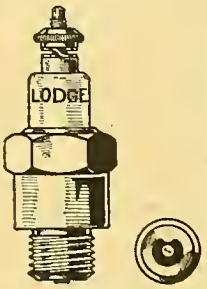
The two-stroke has been altered and improved in many small details. The engine will remain the same as this year, except that the design of the exhaust port will be altered slightly, and will be of rather larger dimensions and with slightly tapering instead of perfectly straight sides, as at present.

The compression release valve will also be larger, so as to give an absolutely free release of the compression for starting purposes. Mr. Green told us of some experiments he has been carrying out in connection with the lubrication system, and said he was rapidly being won over by the system which supplies the lubricant to the induction passage, owing to its cleanliness.

A New Sparking Plug for Two-strokes.

Special Design to Withstand Heat and Oil.

THE mysterious but more or less trifling troubles which attend the running of some two-stroke machines, especially those of the air-cooled variety, can, as a rule, be traced to faulty plugs. Probably the most common troubles are inefficient lubrication and faulty plugs causing pre-ignition. The first is due to the fact that there is so short an interval between the explosions that the plug has very little time to cool; the second is most often due to the method of lubrication, which, in the majority of two-strokes, is of the petroil system, the oil therefore readily entering the combustion chamber, and becoming rapidly deposited on the plug electrodes.



A new Lodge plug for two-stroke engines

In an attempt to overcome these troubles the Lodge Sparking Plug Co. have designed a special plug for use in two-stroke engines. The plug is of the single gap variety, and the central electrode is of a very substantial nature; the other point is formed by a circular piece of metal with a hole in it through which the central electrode protrudes. This piece is let into the end of the plug body, and at one point has a slight protuberance, which forms the second electrode.

It is stated that the plug is designed in such a way that the heat is rapidly conducted away from the electrodes, while sparking is unaffected by oil.

Enquiries having reached us respecting the marketing of the new Levis 5-6 h.p. horizontal twin-cylinder two-stroke machine, we communicated with the makers on the subject, who inform us that the Admiralty are having first call of these engines. They are, therefore, not likely to be offered to the public for some time to come.

B.S.A —

1916 Catalogue Now Ready

The "Daily Telegraph" says:

"Regularly with the autumn comes along the B.S.A. Motor Bicycle Catalogue, always interesting and always helping to uphold worthily the great B.S.A. traditions. The issue for the ensuing season is as interesting and well produced as ever. . . . Undoubtedly the outstanding features of the 1916 Catalogue are the beautifully printed full page colour plates, which give a correct rendering of the appearance of the various models, and it is safe to say they mark the highest advance yet achieved in motor cycle illustration."

The "Motor Cycle" says:

"The 1916 B.S.A. Catalogue is a fine production, and the colour plates of the complete machines are very pleasing. The latter are accompanied by full specifications of the models they illustrate."

The "Autocycle" says:

"The 1916 B.S.A. Catalogue of motor cycles is conspicuous by the excellence of its coloured illustrations of the firm's products."

ROYAL ENFIELD

Whatever type of motor cycle you require there is a Royal Enfield model to suit—and in every one the famous Enfield Two-speed Gear, Cush Drive Hub, and Chain Transmission are embodied. Royal Enfields are reliable.

The illustration above shows the 6 h.p. Royal Enfield sidecar combination. There never has been a more satisfactory passenger model than this—it is the standard of quality and efficiency the world over.

Four great Allied Armies are all using Royal Enfields.

At 40 guineas
The 2¼ h.p. Royal Enfield Two-stroke Lightweight.

At 50 guineas
The 3 h.p. Royal Enfield.

At 85 guineas
The famous 6 h.p. Royal Enfield Sidecar Combination.

At 100 guineas
The 6 h.p. Sidecar Combination. Complete with Lucas Dynamo Lighting Set, etc.

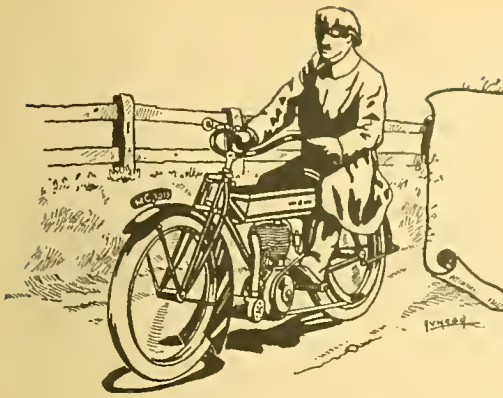
Mention "The Motor Cycle" and write for the Royal Enfield Catalogue.

THE ENFIELD CYCLE CO., LTD., REDDITCH.

Contractors to His Majesty's Government, the French and Belgian Governments, and the Russian Military Authorities.

London Office and Showrooms: 48, Holborn Viaduct, E.C. **Agents Everywhere.**

In answering this advertisement it is desirable to mention "The Motor Cycle."



CYLINDER COOLING.

Is the Modern Air-cooled Cylinder with Cast Iron Flanges Sufficient?

REFLECTIONS ON Mr. LANCHESTER'S PAPER.

THE ordinary air-cooled engine of the motor cycle is so satisfactory that at first sight one is inclined to think that it is hardly open to improvement so far as its extremely simple cooling methods are concerned; or if we think of improving the cooling at all we are apt to turn instantly to water-cooling, with all its weight, complications, and delicacy. However, a new light has been thrown upon the whole subject of cylinder cooling by Mr. F. W. Lanchester in his magnificent monograph, "The Cylinder Cooling of Internal Combustion Engines," which was read last week before the Institution of Automobile Engineers. Mr. Lanchester's gifts and achievements as a scientist, a mathematician, and an automobile engineer are well known, but many have forgotten, if they ever knew, that the cars first associated with his name were driven by air-cooled engines. Concerning these engines some very interesting and significant facts were brought to light by Mr. Lanchester. The first were made with thin cast copper gills or flanges, which were shrunk on to the plain cylinder barrel. These were very satisfactory. As great or greater satisfaction was obtained by substituting spun sheet copper gills for the cast copper or aluminium flanges. With the thinner material, double the number of flanges could be used, and although, of course, the cooling power was not doubled it was materially increased. At this point, and for the convenience of manufacture, the separate gills were abandoned and flanges cast integral with the cylinder were substituted. These were a failure not merely because it was not practical to cast as large a number of flanges per cylinder this way as with the separate flange or castings, but also on account of the fact that cast iron was used, and the conductivity of copper is approximately ten times greater than that of cast iron, while the conductivity of aluminium is about half that of copper.

Food for Thought.

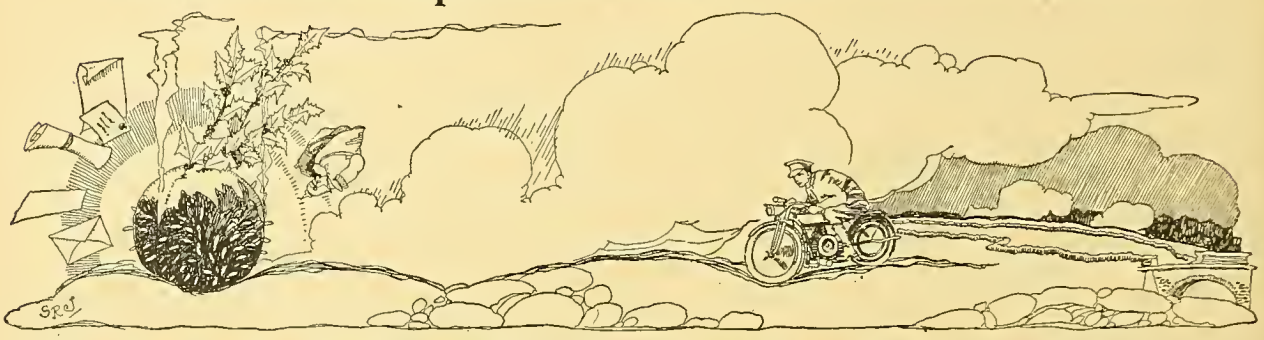
This bare recital of facts is full of interest and suggestiveness to the motor cycle designer, because it is obvious that to-day the motor cycle cast iron cylinder with its flanges cast integral is but a perpetuation of Mr. Lanchester's least successful effort. His spun sheet copper flanges and his separately cast aluminium or copper flanges had succeeded where the cast iron flanges had failed. We do not say that this is any reproach to the motor cycle designer, for, if it be, he sins in good company, as practically all air-cooled aero engines follow motor cycle practice in using cast iron or steel flanges which are part and parcel of the cylinder itself. Mr. Lanchester shows in his paper, both by theory and practice, that much more satisfactory cooling can be obtained by the use of metals of higher conductivity than cast iron, and the thing is so obvious that one cannot help wondering how it is that no investigator has followed it up before. It is true that sheet metal cooling flanges have been used on motor cycle engines, and we believe that separately cast flanges have also been employed; but the experiment has evidently been vitiated by some other conditions, or at any rate its advantages have not been appreciated.

At this point it is well to ask ourselves why we should consider the expense of separate flanges of copper when we are getting highly satisfactory results with integral flanges of cast iron. We should, therefore, say that the reason why we think the subject is so well worth further investigation by the motor cycle engine designer is that the active mileage of the air-cooled motor cycle engine would be greatly prolonged if it ran somewhat cooler. It follows that with better cooling we should have less burning and pitting of the valves and seatings, fewer sparking plug troubles, less carbonisation, and cleaner piston rings.

Air-cooled or Oil-cooled?

It may be said that in a way the air-cooled engine is partly oil cooled. This is not strictly the fact, but the results are the same. In other words, the great heat of the cylinder walls burns up the oil so quickly that considerably more oil must be used than if the walls were cooler. This large amount of oil which is necessary means that whenever the engine is running on a partly open throttle or with the throttle closed, that it is more or less over-oiled, and this excess of oil is burnt above the piston, resulting in carbonisation of the piston and the cylinder head, and in the fouling of the rings. No arguments are necessary to show that the valves, valve seats, and plugs would run longer without attention at somewhat lower temperatures, and it therefore follows that satisfactory as the present system of air-cooling may be it is decidedly open to improvement, and Mr. Lanchester's paper has shown the lines along which the designer can experiment with the minimum of uncertainty. In any case, there is no doubt that the paper will have a marked effect on the future design of air-cooled aero engines which in their turn will react upon motor car design, in which, as our readers know, water-cooling is to-day paramount. However, air-cooling is essentially the motor cycle engineer's province, and we feel certain that he will be among the first to profit by the volume of fact which Mr. Lanchester has placed before him.

Christmas Despatches from Service Readers.



On this and the following pages will be found Xmas Messages from men well-known in the motor cycle world now serving their country in one capacity or another. Some are from men on active service, others from those still at home, and all show the quiet confidence in final victory that is a feature in all ranks.

LIEUT. VERNON BUSBY, R.E. and R.F.C. *(a leading Birmingham competition expert).*

"All the old sporting circle of motor cyclists are now far separated serving their country. I much appreciate *The Motor Cycle* scheme of exchanging good wishes with old friends whom I hope soon to meet again back in old surroundings and ready to fight in that other war of maintaining the supremacy of the British motor cycle industry throughout the world. My wishes to all are the best of luck and a safe return."

H. D. TEAGE, R.A.F. instructor on aero engines *(formerly of "The Motor Cycle" staff).*

"To all my old friends—may 1915 be your worst year."

LANCE-CORPL. A. B. WADE, No. 1 Battery, M.M.G.S. *(highly successful hill-climber with twin Zenith).*

"Hearty greetings and good wishes to friends at home. Don't be depressed. We are 'top dogs.' Keep everything in good tune and we will be looking forward to a London-Exeter Run for next Boxing Day, and may we all have a happy re-union before then."

SERGT.-ARTIFICER L. A. BEES, A.S.C., attached to Motor Machine Gun Service *(formerly competition rider of L.M.C.)*

"Expect to go overseas very shortly to join the boys. Good luck and a Merry Christmas to those at the Front and those on the way."

J. S. IRVING *(organiser of the R.A.F. Munition Workers' Meeting at Brooklands, for which there were no less than 265 entries).*

"Comrades! Sincere wishes for safe conduct through the conflict and a speedy return. May you all safely receive Christmas puddings and suffer less than your less active comrades at home."

2ND-LIEUT. G. T. GRAY, R.E., Motor Cycle Section *(a successful competition rider of Rudge).*

"To all despatch riders serving abroad, and especially to fellow competition riders, Christmas greetings! May you have a congenial gathering in the mess, and for a day at least forget all about stew, bully, and dog biscuits. May you all have the best of good luck throughout the New Year."

LIEUT. J. W. WEIR, R.E. *(leading Irish motor cyclist and secretary Motor Cyclist Reserve Committee I.C.).*

"The best of luck, and a peaceful and glorious Christmas at home next year. Best wishes to you personally and your very interesting paper."

SERGT. H. KARSLAKE, R.F.C. *("Oily" and his Dreadnought are very well known figures in motor cycling club circles).*

"Heartiest greetings to the boys overseas. They have done, and are doing, great deeds, as I have seen. Keep the flag flying and show 'our friends the enemy' that the motor cyclist makes the best of sportsmen."

Xmas Messages.—

DR. A. M. LOW, R.F.C. *(member A.C.U. Committee).*

"I have been away experimenting at flying station, and only hope motor cyclists are not working day and night as I am. Best wishes."

SERGT. E. J. BASS, R.F.A. *(well known in Essex club circles).*

"My kind regards to all my motor cycle friends. I trust that all will have a successful and peaceful 1916."

CORPL. ERIC WILLIAMS, D.C.M., 23rd Infantry Brigade, Headquarters 8th Division *(winner Junior T.T., 1914, on A.J.S.)*

"The order for the day is, for many of us, the same as last year, but this does not damp my spirits, so here's to all of you this Christmas and to 'The Day' when we all meet again, may it be in 1916."

SERGT. ALBERT MILNER, R.E. *(a Midland rider of Levis machines).*

"A Merry Xmas and Happy New Year to all my old friends at home and overseas. Kindest regards and good luck to Archie Sproston, Charlie North, and the rest of the boys I know, and here's hoping to see them all at Quarter Bridge before 1916 is out."

2ND-LIEUT. HOWARD R. DAVIES, R.E., Motor Cycle Section *(Sunbeam trials rider, second in 1914 Tourist Trophy Race).*

"To the despatch riders at present in France, and especially those with whom I was stationed when out there, I send greetings, and I sincerely hope that on Christmas Day they will be able to join together and forget for the moment the hardships and anxiety which they are called upon to endure whilst on duty. May happiness and the best of good luck attend all throughout the coming year!"

CORPL. W. PRATT, A.S.C. *(formerly P. and M. rider, captain of British trade team in Anglo-Dutch Trial).*

"*Bonne chance*, boys! May we soon be all together again on the good old English roads. Should this message meet the eyes of Archie Sproston (Dardanelles) and Bob White (France), will they accept it personally."

SERGT. NORMAN LONGFIELD, Motor Machine Gun Service.

"Dear *Motor Cycle* and all at home in dear old England,—As jolly a Christmas as you wish yourselves, and may the New Year see us all once more in the only country worth living in, and all talking of reliability trials and T.T. races, and, if possible, participating in them. *Bonne santé, bon courage, bonne chance.*"

PTE. F. G. BALL, A.S.C., M.T., Repair Base *(successful competition rider of Douglases).*

"Taking all points into consideration, it is surprising how well the modern motor cycle is standing the racket of war service conditions. It is quite the exception nowadays to meet with defective workmanship or ill-chosen design since manufacturers have profited by the military riders' experiences. With best wishes for Christmas and the New Year."

LIEUT. F. M. C. HOUGHTON, Flanders *(originator of "All-khaki" Meeting at Brooklands).*

"To those at home the 'All-khaki' Meeting is a thing of the past, but there is another one with room for heaps more competitors. So buck up and help us along to the finish. And, to those who 'stand and wait,' keep it up and take the place of those who have gone. Keep the motor bicycles going till the boys come home. A Merry Christmas to all."

LIEUT. D. H. NOBLE, A.S.C., on active service *(Rover competition rider).*

"Christmas greetings to all motor cyclist brothers-in-arms. May the New Year see us all back in England. *Strafings* to all sidecar chassis designers! May their Christmas dinners give them new ideas, so that a sidecar will run at least a fortnight out here without falling to pieces."

STAFF-CAPT. W. B. LITTLE, 151st Brigade *(a Lakeland motor cycle mountaineer).*

"Greetings from my dug-out home! The most acceptable Xmas gift this year of the readers of *The Motor Cycle* would be—*themselves* given to King and Country. The infantry needs them."

PTE. S. A. M. WHITHAM, A.S.C. *(late of Singer and Triumph Companies).*

"The Darinétar (Rouen) motor cycle repairers wish *The Motor Cycle* a prosperous New Year, and hope that the war will end with all speed. A happy Xmas to all and the best of good luck for the coming year!"

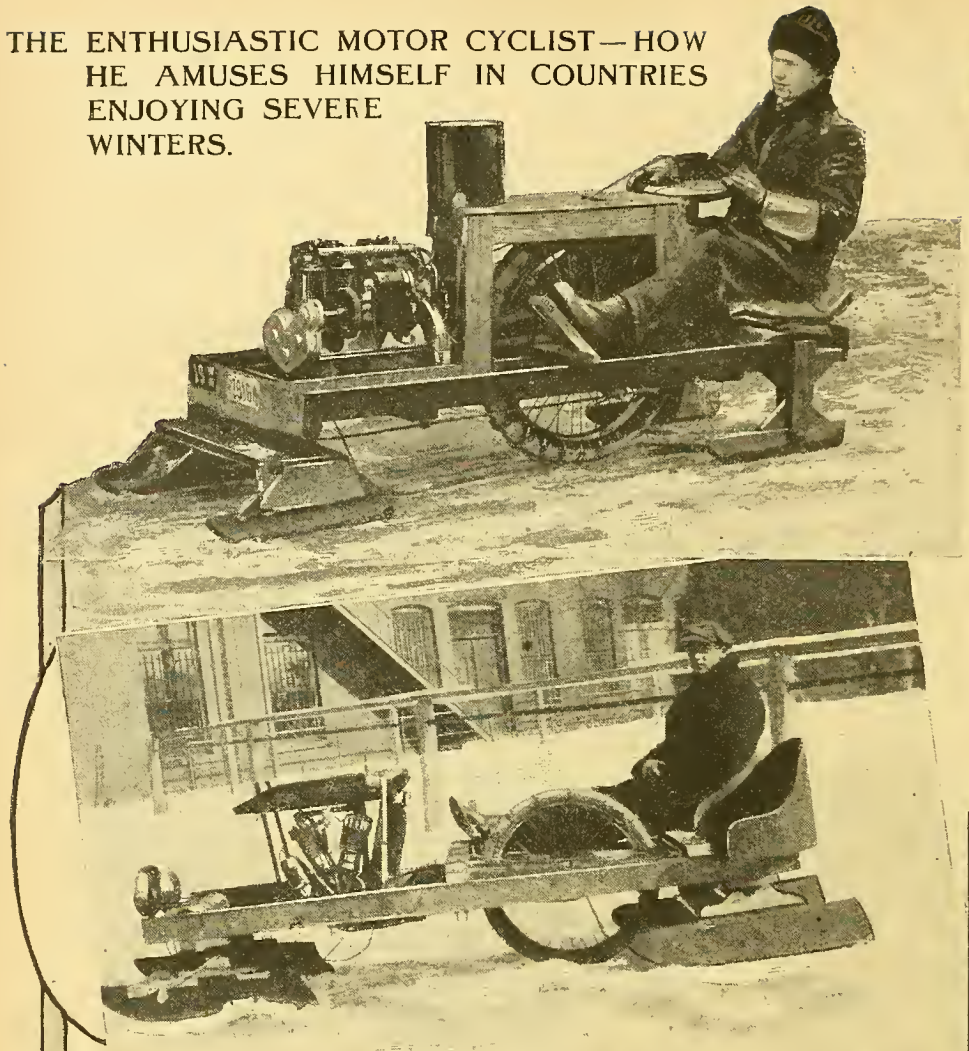
LIEUT. S. A. ROWLANDSON, A.S.C., on active service *(formerly Rudge competition manager).*

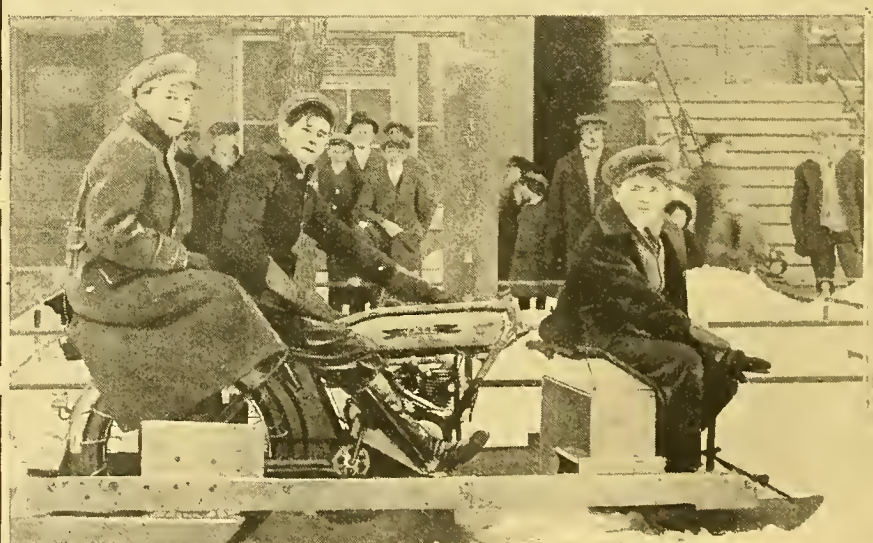
"To all my old friends and acquaintances, those met in 'Six Days' trials, T.T.'s, Grand Prix, and Olympia Shows, greetings from this show over here. What with no TT., no show for two years—well, it is a bit thick, but we do not have to worry about which group we are in."

2ND-LIEUT. S. W. CARTY, A.S.C., M.T. *(a leading North-country motor cyclist and club founder).*

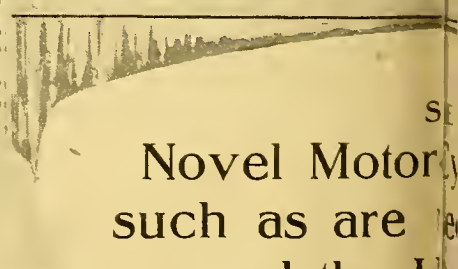
"Here's the best of good luck to all motor cyclists in the coming season. May they all do their duty by the country that gave them birth, and more power to your own elbow!"

THE ENTHUSIASTIC MOTOR CYCLIST—HOW HE AMUSES HIMSELF IN COUNTRIES ENJOYING SEVERE WINTERS.





MOTOR sleighing is a popular sport in North America, and the accompanying photographs, which were taken in Canada and the States, will produce envy in the minds of many of our readers. Sleighing, and in particular motor sleighing, owing to climatic conditions, cannot be enjoyed in this country to anything like the extent it is on the other side of the Atlantic, as our spells of winter are short and sporadic. But in the piping times of peace young enthusiasts who own motor cycles might get some days' sport if they cared to go to the trouble of converting their machines to the shapes illustrated on these pages. The point is that, apart from Scotland and the North, it is the exception to get more than a few days throughout the winter on which sleighing is possible.



Novel Motor
such as are
and the U

Great ingenuity has been displayed in the conversion of the outfits illustrated. With the exception of the four-cylinder Henderson in the left-hand top corner they are all typical American twins, and all the tyres are fitted with non-skid chains. Some riders have stripped their machines more than others. For instance, compare the two Indians on the right. The centre one is minus the cycle frame, while the lower one contains the motor cycle complete, except for the front wheel. Another interesting comparison is in the methods of steering employed.

Appearance is not studied, though the owner of the outfit shown in the centre has evolved quite an attractive affair. The car-type bonnet and dash not only improve the appearance but also provide a certain amount of protection for the feet and legs.

All, however, look as if they would provide fine and most exhilarating sport.

WE OFTEN REFER TO THE ADAPTABILITY OF THE MOTOR CYCLE—THESE ILLUSTRATIONS GIVE FURTHER PROOF OF OUR CONTENTION.

TIMES TO LIGHT LAMPS.

GREENWICH TIME.

Dec	23rd	4.52	p.m.
,,	25th	4.53	,,
,,	27th	4.54	,,
,,	29th	4.56	,,

In London half an hour earlier.

Overseas Trials.

Just as this issue goes to press we have received from our Overseas correspondents photographs and particulars of trials held in Holland, South Africa, and New Zealand, and they will be published next week.

Special Features of this Issue.

In accordance with our usual custom, this being the Christmas issue of *The Motor Cycle* contains several features of a seasonable nature.

A number of readers well-known in the motor cycling world and who are serving their country in various capacities have sent Christmas greetings.

Flight Lieut. Wilberforce.

The statement in our last issue respecting Mr. Victor Wilberforce, made on the authority of Mr. W. W. Douglas, is, happily, untrue. We have received a communication from Mrs. Wilberforce stating that her son is now at home on leave. Needless to add, we are only too delighted to make this announcement, and offer Mrs. Wilberforce and her son our sincere apologies. Flight Lieut. Wilberforce joined the R.N.A.S. before the outbreak of war, and has been on active service ever since.

N.W.A.A. Meeting.

The annual general meeting of the N.W.A.A., which constitutes the north-western centre of the A.C.U., was held in Liverpool on Saturday last, Lieut. T. A. Moulds being in the chair. It was resolved, owing to the extremely difficult circumstances now prevailing, and the utter stagnation of the sporting side, that the Association should be suspended until the end of the war, or whenever it may be possible to resume activities. Three trustees were appointed to look after the interests and affairs of the Association, these being Messrs. Moorhouse, of Bury; Whithouse, of Oldham; and Kettle, of Liverpool.

Trend of Design.

Still another four-stroke lightweight made by a firm hitherto specialising on two-strokes is illustrated and described in this issue.

Home-made Mudshields.

A reader resident in Siam, who regularly rides in white cotton suits, has sent us particulars of a neat and simple mudshield he has rigged up on his Sunbeam. It is referred to an page 638.

The National War Funds.

At the week-end the principal national relief funds stood as follows:

The Prince of Wales's Fund ..	£5,657,546	0	0
The *Weekly Dispatch* Tobacco Fund	93,257	0	0
The Times Fund for the Sick and Wounded	2,755,068	0	0
The Queen's Work for Women Fund	167,497	7	4
Daily Chronicle Xmas Gift Fund (concluding total) ..	21,871	4	7

The New Lighting Regulations.

The new lighting regulations have now been issued by the Home Office, and will come into operation on January 10th, 1916. With reference to rear lights, a month's grace is allowed in those places where the rule is not already in force.

The restrictions in those areas contained in Schedule I. are as follow:

ELECTRIC LAMPS.—The bulb must not exceed 12 watts, or give in use a greater candle-power than a 12 watt (12 nominal c.p.) bulb as standardised for side lights by the Engineering Standards Committee. The front glass, if circular, must not exceed 6in. in diameter, and if rectangular, the longer side must not exceed 6in. The whole of the front glass must also be obscured with one thickness of ordinary white tissue paper.

ACETYLENE LAMPS.—The burner must not consume more than 14 litres (half cubic foot) per hour, and the size must be as above. The whole of the front glass must be obscured with one thickness of white tissue paper, or with paint, ground-glass, or a disc of some other uncoloured material, so that the obscuring effect is not less than that of one thickness of ordinary white tissue paper.

OIL LAMPS.—One burner only is allowed, and the wick must not be more than $\frac{3}{8}$in. in width.

SPECIAL FEATURES.

THE ELOPEMENT OF ARAMINTA.
BLUFF.
CHRISTMAS DESPATCHES.

SIDE PANELS.—With the exception small red or green side panels, these m be covered with some opaque materi

The material used for obscuring light must not be wetted or treated any way to reduce its opacity.

The same restrictions apply in th places mentioned in Schedule II., b in addition, an opaque disc of card some other material having six ho such as we exclusively described in *Motor Cycle* of December 9th, page must also cover the front glass. T disc must not interfere with the i mination of the number plate.

ALL vehicles must show a red light the rear *by means of a rear lamp.*

Lighting-up time is now half an h after sunset, instead of one hour formerly.

DISTRICTS AFFECTED BY THE ORDER

SCHEDULE I.—The whole coast wit six miles of the sea or navigable wat of an estuary. The counties of Angles Bedford, Cambridge, Durham (nea all), Essex, Hants, Herts, Hunts, Ke Lincoln, Norfolk, Northumberl (nearly all), Suffolk, Surrey, Suss Yorkshire (nearly all). Important to in Berks, Bucks, Lancashire, Leices Northants, Notts, Stafford, Warwi The boroughs of Stockport and Ches field.

SCHEDULE II.—Bedford, Luton, C bridge, Darlington, Hartlepool, Jarr Stockton-on-Tees, Durham, Gateshe South Shields, Sunderland, Colches Harwich, Southend-on-Sea, Portsmou Chatham, Dover, Folkestone, Gilli ham, Gravesend, Hythe, Maidsto Margate, Ramsgate, Tunbridge We Grantham, Louth, Great Grimsby, L coln, Great Yarmouth, King's Ly Norwich, Peterborough, Berwick, Wa end, Newcastle, Tynemouth, Bury Edmunds, Lowestoft, Ipswich, Goo ming, Guildford, Reigate, Bexhill, Ho Brighton, Eastbourne, Hastings, B lington, Hull, Middlesbrough, S borough, Thornaby-on-Tees, and York

An American Trip.

Mr. Robertson Brown, British agent for the Henderson four-cylinder motor cycle, who is paying a visit to the Henderson factory in America, has just supervised the shipment of sixty-three machines to London. It is interesting to note that he has expressed the opinion in America that, after the war, there will be several British machines fitted with four-cylinder engines.

Cumberland County M.C.C Record.

The annual general meeting of the Cumberland County M.C.C. was held at the club's headquarters, Crown and Mitre Hotel, Carlisle, on November 27th; Mr. D. R. Leech in the chair. Owing to a very large percentage of the members of this sporting club being on active service the attendance was small. It was announced, and received with keenest regret, that two of its gallant members had already laid their lives on the altar of patriotism, viz., Lieut. G. N. Frazer, who fell when nobly leading his company at Neuve Chapelle on March 10th, and Lieut. Dick Gilbanks, who fell in Gallipoli on August 9th, when with splendid heroism he was leading and cheering on his men. The president, Mr. Christopher W. Lowther, is recovering from his very severe wounds. Members of this club who are serving their King and country have been made honorary members for the period of the war. The activities of the club have been suspended for the duration of the war, and practically all its funds invested in War Loan. A small committee has been appointed to look after the club's interests. Mr. W. B. Anderson, 157, Warwick Road, Carlisle, is hon. treasurer; Mr. T. Rutherford, 79, West Walls, Carlisle, hon. sec.

Mr. and Mrs. R. G. Page, of St. Leonards-on-Sea, in their 3½ h.p. Rover sidecar. No better testimony to the reliability of the modern motor cycle will be found than the number of middle-aged people who indulge in motor cycling nowadays. Mr. and Mrs. Page have a son and daughter who are motor cyclists.

Greater Britain Still Answering the Call.

Among last week's enquiries respecting recruiting letters reached us from Australia, Singapore, F.M.S., South Africa, and Jamaica.

A Well-known Motor Cyclist Married.

On Friday last S. L. Bailey, the well-known Douglas rider, who is now holding an important position with Messrs. Douglas Bros., Bristol, was married to Miss Pullin, the sister of C. G. Pullin, who won the Tourist Trophy Race in 1914.

Police Traps—Threatened and Actual.

The Automobile Association is informed that proposals have been made for the establishments of speed limits for motor cars in Aspatria, Penrith, and Longtown (Cumberland). The local Highways Committee resolved that the matter be referred to the police with a suggestion that proceedings might be taken against motor drivers if found to be driving to the danger of the public.

Traps are in constant operation along the Barking Road, East Ham, and Aldersbrook Road, Wanstead Flats.

Average Prices.

We give below the average prices of second-hand models offered for sale in *The Motor Cycle*. Where it is possible to obtain a sufficient number of each model the average for the past week is quoted. If there were not at least two advertisements, then the last occasion on which they were quoted is given.

A Flying Visit to the United States

Mr. W. H. Wells left for America last week, his intention being to visit the Indian factory with a view to improving the delivery of machines intended for the British market. According to Mr. Wells, American manufacturers are finding difficulty in obtaining raw material, but he hopes to help matters by arranging to fit still more British equipment on the Indians sold here, and, incidentally, avoid the tariff. He had as companion Mr. Chas. Jarrott, the well-known motorist, who, we understand, has gone to America in connection with motor car requirements of the Government.

Dublin and District M.C.C. Dinner

The annual dinner of the Dublin and District Motor Cycle Club took place on Thursday of last week. The proceedings, in which many Cork Club members joined, were very enjoyable, and the evening's entertainment was greatly added to by a very excellent musical programme. Mr. G. A. M. Curtis, the president of the club, occupied the chair, and had on his right the president of the Cork Club, Mr. Frank Daly.

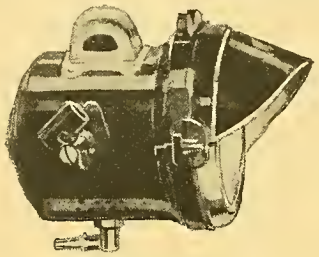
The president distributed the prizes won in the numerous competitions of the club during the season, the chief trophy, the Rudge-Whitworth cup, for the club's open twenty-four hours trial, being shared by the honorary secretary, W. H. Freeman, and T. O'Toole, while the Roche cup for the Glengarriff and back two days event went to A. W. Mooney. These cups, and also the large number of minor ones, were duly filled and circulated in the customary manner.

Mr. Charles Jarrott and Mr W. H. Wells leaving Euston last week *en route* for the United States. The former is making the trip on Government work, the latter to visit the Indian factory.

F.R.S. LAMPS FOR 1916.

FOR next year the F.R.S. Co. is marketing three new types of lamps, each one type having certain improvements either in design or manufacture, while the 8 volt dynamo has been redesigned as regards certain of its details.

The chief new model is the F.R.S. Junior, a substantially made gas lamp having an improved parabolic mirror and a lens front glass in place of the old flat glass. In deference to the new lamp



The F.R.S. Junior lamp.

regulations, the lugs by which the lamp is secured to the bracket now are soldered to the side spindles of the lamp, and as these lugs are set to fit the F.R.S. bracket no further adjustment is necessary. The finish is for the most part black, so that it is easy to clean.

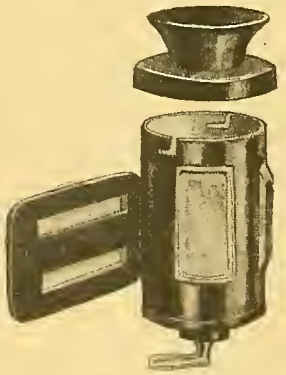
Two new tail lights now are marketed. One—a black finished circular lamp with a slotted plate riveted to the body, in order that the light may be adjusted to the number plate—is priced at 4s. only. It is extremely strong, has good wide air holes, and the top is made with a bayonet fitting so that access may be obtained to the burner. It has been found that a loose top is less often lost than a detachable underplate.

The other tail lamp is nickel-plated, costs 5s. 6d., and has also a slotted plate for adjustment on the number plate. The lamp body is triangular, and the front (that part with the red disc) opens on a hinge when a loop-headed pin has been withdrawn.

The Dynamo Outfit.

As regards the dynamo, readers will remember that it gives light for a 40 c.p. lamp, and a beam which renders anyone recognisable at a long distance with a lamp of 7in. front.

The appearance of the machine is exactly the same as it was when last described, but the detachable cover over the brush gear is fitted now to bed down evenly and so remain watertight under the worst conditions. This necessitates certain minor alterations to the end plate and the removal of certain lugs.



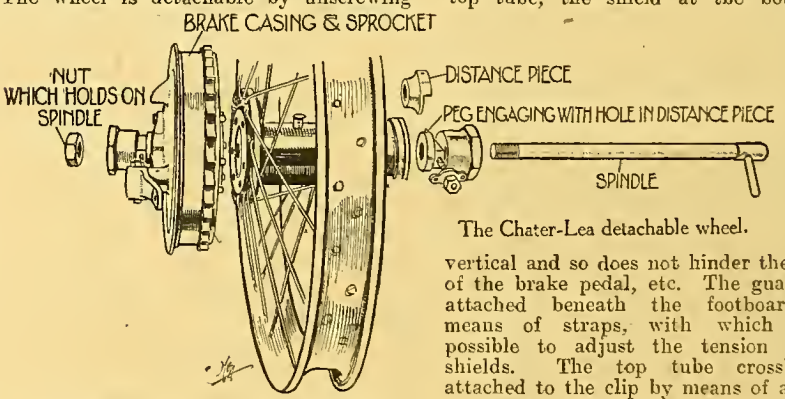
The black finished F.R.S. tail lamp.

The brush gear itself is now altered, and instead of the brass brush holders insulated with bushes of vulcanite there is now an extension of the aluminium centre piece which carries the brushes, their springs and the leads. To insulate the brush from the body sheet vulcanite is used with bushes of simpler form, while the cables or leads have beads of vulcanite strung on them, so preventing any contact with sides or cover.

In the 1915 Douglas dynamo an extra flywheel was fitted upon the gear box shaft outside the big sprocket of the Douglas, the dynamo being clipped to the seat-pillar and driven from this flywheel. Now, however, a small aluminium pulley is fitted upon the gear box shaft and clamped thereto by the big sprocket securing nut.

CHATER-LEA DETACHABLE WHEEL.

MESSRS. CHATER-LEA, LTD., have introduced for their latest No. 7 sidecar outfit a detachable wheel, a desirable innovation which will be much appreciated. The wheel runs on standard Chater-Lea waterproof journal bearings, which have been specially adapted for the purpose. The wheel is detachable by unscrewing



The Chater-Lea detachable wheel.

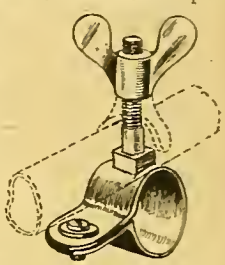
the nut shown on the extreme left hand of the sketch, and removing the ingenious distance piece. When this has been accomplished, the wheel can be detached. There are six pegs in the internally expanding brake casing, which engage with six holes in the wheel hub, through which the drive is taken. When the wheel has been withdrawn, the brake and sprocket remain *in situ*.

NEW GLORIA SIDECAR.

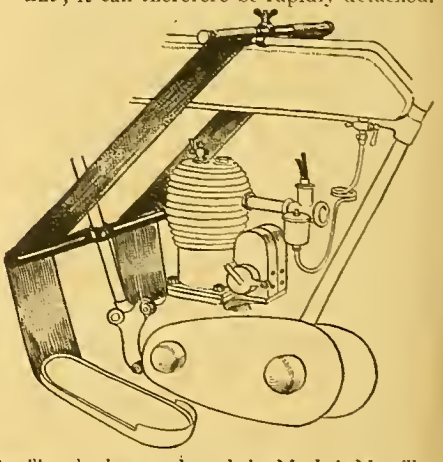
With regard to the new pattern Gloria sidecar illustrated on page 614 of our last issue, we are requested by the Gloria Cycle Co., Ltd., Coventry, to point out that they are not in a position at the present time to execute orders, and, as far as can be seen at present, the firm will be unable to place the new design on the market until after the war.

A NOVEL MUDSHIELD.

A RATHER novel and at the same time somewhat unusual type of mudshield has been invented and fitted to a Sunbeam motor cycle by a Mr. J. A. Macgill, of Bangkok, Siam. The chief advantages of these guards are that, in combination with a reasonably efficient front guard, they afford perfect protection from mud, wet, and cold for the rider's legs and feet, yet at the same time the air is not prevented from reaching the engine. They are extremely simple and are rapidly attached or detached. The guards consist of two strips of varnished leather or some similar material attached beneath the footboards, carried over a crossbar situated some six inches above the front of the footboards, and then carried back and attached to another tubular crossbar situated in any convenient position on the top tube, preferably as near the rider's legs as possible. The idea of carrying the leather over the lower front crossbar is so that, if it is desired to attach the top ends well back along the top tube, the shield at the bottom is vertical and so does not hinder the action of the brake pedal, etc. The guards are attached beneath the footboards by means of straps, with which it is possible to adjust the tension of the shields. The top tube crossbar is attached to the clip by means of a single nut; it can therefore be rapidly detached.



Clip for securing mudshield to top tube of frame.



Auxiliary leather guards made by Mr. J. A. Macgill, of Bangkok, Siam.

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," Hertford Street, Coventry, and must be accompanied by the writer's name and address.

Winter Lubrication.

Sir,—I should be pleased to hear from some of the many readers of *The Motor Cycle* what is the best lubricant to mix with castor oil for winter riding. I notice that in using thin lubricating oil mixed with castor oil the thin oil rises to the top and does not mix readily.

CONSTANT READER.

Broken Spokes.

Sir,—With reference to the correspondence on the subject of broken spokes in connection with chain-driven motor cycles, our experience may be interesting to you as we have used chain-driven machines now for some years, and such a thing as a broken spoke we have no recollection of, which is undoubtedly on account of the fact that we use a cushion hub. With this system it is of no importance whether the slipping clutch is adjusted up tightly, or *vice versa;* in fact, it is better that it should be adjusted up tightly, otherwise the power of the engine will gradually loosen it, so much so that it will not then keep tight without constant adjustment.

This system of hub is also a wonderful chain saver, the system comprising rubber buffers, and one has only to imagine the impossibility of breaking a steel spoke by pulling at it through a rubber medium to realise what a fine system it is, and for the same reason it can be understood why the chains last so extraordinarily well.

MOTOSACOCHE, LTD.,
OSBORNE DE LISSA, Managing Director.

A Curious Fault.

Sir,—I have a two-stroke machine which has an objectionable fault which perhaps some of your readers can explain.

When travelling at fairly low speeds (15-20 m.p.h.) at times the machine almost pulls up with a violent jerk, resembling a partial seizure of the engine. I always give plenty of oil, and have tried everything I can think of to effect a cure without success. The piston and rings are a free fit and show no signs of seizing at any place.

The symptoms only develop at small throttle opening, never when climbing a hill and never after the first half-hour of a ride. I may say I have written to the makers on the subject without obtaining any explanation. The machine is very powerful for its size, and has a good turn of speed for a two-stroke. The carburetter is a Senspray.

H. WEBSTER MOSS.

Sidecar Stands.

Sir,—Another trouble with sidecar stands is apparent in my 6 h.p. Enfield sidecar combination, 1915. This combination, though extremely well designed generally, suffers from having a front wheel stand with a rounded end where it rests on the ground (probably made so to fit into the front mudguard). The result is that no strain comes on the frame as in the two-legged variety, but the front rolls over on the U, making it difficult to work on the front wheel tyre, unless the handle-bar is tied to the saddle.

N. FIELDER.

Winter Riding.

Sir,—Although I have taken in your admirable paper for some years, this is the first offence as a correspondent. I have been reading your article on "Hints and Tips for Winter Riding," and may I suggest the use of disc wheels? About two years ago I fitted a set to my Triumph machine, and they have not been removed since. I find that the mudguards do not get so much choked up now as was the case previously. I am often asked if I suffer trouble with the wind. Well, to tell you the truth, my only trouble is when I am riding on greasy *pavé* and there is a stiff wind, then, to counteract that, I always ride very carefully. Up to now I have not had a single slip or fall through my disc wheels. But I advise anyone who does fit them to use low semi-racing bars; they are far steadier.

They (disc wheels) are also easily made from sheet aluminium. Cut round a little larger than the rim of your wheel, and a hole cut in the centre for the hub. Then cut from edge to centre, and rivet together to make a cone shape. Then put one disc either side and bolt together with about eight nuts and bolts, which will never rattle loose. Mine cost me, ready cut to size, 8s. They are also a fine preventive for grit getting into hubs. Another tip is this. Continue your front mudguard a little over half-way round the front wheel, as there is always a certain amount of mud taken round to that point. When one is travelling fast or against a head wind it is all blown back on to the cycle, so that if this is guarded the mud is then thrown either on to the mudguard or else the ground again.

CHAS. DAUNTON-SHAW (Trick Cyclist).

A Novel Test of Engine and Clutch Efficiency.

Sir,—Being very interested in the article in your issue of November 25th last, I was recently able to test my own machine in a similar manner, and was rather surprised at the results obtained, so am writing you to see if the method of testing were carried out correctly. In the first place, a spring balance was obtained, reading up to 300 lb. and fitted with a maximum hand; this was roughly tested for accuracy by weighing myself upon it. One end of the spring balance was secured to a ring in the wall at a convenient height, the other end being attached to the back rail of luggage carrier by a short length of rope. The engine was then started up, with the wheels on the ground, and the clutch gradually engaged, the throttle being also opened to get maximum power. The first reading registered a pull of 90 lb., which could easily be maintained for, say, half a minute, the engine running at about 1,500 to 1,750 r.p.m. Other readings of 95 to 100 lb. were afterwards obtained, and one of 110 lb., which latter, however, caused the engine to konk out.

As these results do not compare with those obtained by Messrs. The Headingley Motor Co., perhaps you can throw some light on the subject. These results can be vouched for by Mr. C. Foster, of the Coventry Magneto Repairing Co., 9a, Fleet Street, Coventry, at whose premises my machine was tested, and who would no doubt be willing to carry out a test on any of the local motor cyclists' machines.

My machine is a self-assembled one, having a 1912 3½ h.p. Triumph engine, B and B. carburetter (30 jet), and a Villiers clutch, single gear ratio 4.75 to 1. The valve timing is not the makers' standard, but has been set according to various hints culled from the pages of *The Motor Cycle*. It is also fitted with a M-L magneto, which is a soundly-made British article, and has proved to be a very reliable instrument, and one which will really give a fat spark at a low engine speed.

ESLUH.

[The test appears to have been carried out correctly, and our correspondent is to be congratulated upon the excellent results obtained.—ED.]

Fittings on American Motor Cycles.

Sir,—Your article in your issue of December 9th in reference to the failure of American manufacturers to adapt themselves to English ideas has struck me as being radically unfair and also written by one who has not had very much experience of American machines.

The first thing I have to complain about is your statement to the effect that *machines sent over here by American manufacturers are fitted with 3½ to 1 gears and are not suitable for sidecar work.* I consider this is misleading to your readers, especially considering the wide circle of popularity your paper enjoys. You seem to forget that 3½ to 1 gear is a standard solo gear, and I have no hesitation in saying that if a rider enquires of the maker of the machine and explains he will use it for sidecar purposes the necessary sprockets are obtainable which will give him any gear he desires. As an instance of this I quote the Harley-Davidson service, holding no brief for this company whatever, but being a great admirer of their pushful methods and the thorough business-like way in which they conduct all their transactions.

My second point is in reference to the lever controls. *You oppose the handle-bar control,* which is simplicity itself, and for all-weather riders is the ideal. How many thousands of riders will speak of the incessant trouble they get after a wet day's riding, of grit and rain getting underneath the protector of the air and throttle levers, and in the morning when they come to use the machine their air and throttle lever rusted up.

I have little to add to what I consider absurd remarks in reference to the *Bowden wire control to the gear,* but, as an Englishman, and one who likes to see fair play, and a rider of some twelve years' experience, I consider the American and his methods in dealing with spare parts alone miles ahead of the English manufacturer. Where is the firm to-day in England who, on receipt of a telephone message, will despatch one of its mechanics by the first train because one of its riders is hung up, and when the question of expense arises writes and informs the customer there is no expense to him whatever as this all comes in his guarantee. And do not forget you are manifestly unfair to firms who come to this country and establish English companies, and, in spite of the present tariff, have not altered any of their arrangements in their guarantees which were established before the war.

S. A. SERPELL.

Reading.

[Our correspondent has distorted the views expressed in our article. We have therefore italicised his inaccuracies. Also he has criticised our article without reading it carefully. We did not suggest that all American machines are sent over here fitted with a 3½ to 1 gear for sidecar work, but it is a fact that such ratios were lately not uncommon on machines sent out for demonstration with sidecars attached. This experience of ours is also confirmed by correspondents. With regard to the second point we do not oppose handle-bar control (we think that our more observant readers are quite aware of this), but we pointed out that most English riders prefer the handle-bar levers to the twist grip so popular in America. Thirdly, a Bowden wire-controlled gear was not suggested, and a wire-controlled clutch is by no means an absurdity, but a well tested and successful fitment. Our correspondent writes slightingly of English firms, but we have recently heard of two English manufacturers who have done the very thing which he suggests they never do, viz., Messrs. Rudge-Whitworth and the Enfield Cycle Co., and we have no reason to suppose that these are isolated cases.—ED.]

Rapid Progress of a New Rider.

Sir,—I have recently returned on recuperation leave from the German Cameroons, and take this opportunity of saying how much I have appreciated the valuable information contained in your columns from week to week. I have just taken delivery of a two-stroke machine—my first mount. I was able to ride it through a busy city without the slightest trouble. The next day I did a trial trip of twenty-five miles, the next day eighty miles, the next day fifty miles with passenger on the carrier and a return journey of eighty miles.

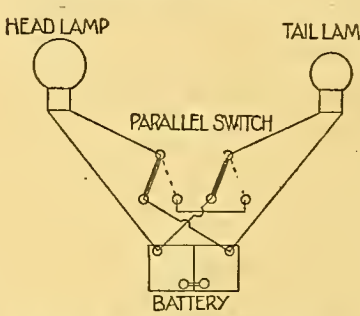
As I had never been astride a motor cycle up to the moment of delivery I consider my experience should be a great encouragement to all intending beginners.

REGINALD ROWLAND (Nigerian Survey).

Varying the Power of Electric Light.

Sir,—I have read with interest the article by "Auriga" on varying the power of electric light, and also the two letters to which he refers.

I would suggest that the best method of dimming the lights is as shown in the enclosed sketch, the wiring of which is quite simple.



With the switch in the position shown, the lamps would be in parallel and giving full power. On switching over they would be in series and the light greatly reduced. The intermediate position would, of course, be "off."

Probably an electrician would find a simpler way of wiring than the one I have illustrated.

W.K.O.-M.

The Psychic Relation between Man and Machine.

Sir,—I entirely agree with those who think there is some sort of understanding between owner and machine. Who has not experienced the "cussedness of inanimate objects"? And this must have its opposite number at the other end of the scale. For instance, who has not taken a bad toss and found the machine unscathed and able and willing to go on at once, as if in sympathy with your bad luck, and anxious to give you fresh heart? And who has not had a poisonous ride when all the elements seem to be doing their level damnedest to stop you, and yet you run through, with the faithful steed dripping with mud and water, but always plugging cheerily away against the wind and dark? Isn't this gratitude for care and attention in the garage, and do not machines often put you to shame by responding gamely to your call on bad hills and in tight corners in spite of your guilty conscience of over-driving and neglect? I am sure of it, according to my experience. I have owned machines which were thorough good companions on the road; also one brute, curiously (or naturally) enough, a Hun make, which was possessed of seven devils, each worse than the first. This leper amongst stink bicycles never missed a chance of doing the dirty on me, in spite of care such as that of a young mother on her first-born. Its crimes were worthy of its ancestors. I ran it 1,000 miles in seven months at a cost of just over one shilling a mile. And then I couldn't get rid of it. I hope it has gone to its makers by now.

Someone in the same number remarks about there being no motor cycles in Gallipoli. There may be none now, but there were in April soon after the landing. I saw several Douglases. One afternoon I saw a fellow riding along a road (such roads!) being sniped by a Turk, of whom there were several behind our lines in those days. It must have been rather boring if the Turk was anything of a shot. Five men of the R.W.Y. went after him, but I could not wait to see if they got him. I saw several at Suvla, too, but the Peninsula is not the country for them.

I fear I have been very verbose, but it is a great pleasure to read and write about the pastime—if one cannot enjoy it.

H.M.S. *Euryalus.* C. T. NUTHALL, Lieut. R.N.

[Our correspondent returns to an old topic, but as he is on Active Service with the Fleet his letter has taken many weeks to reach us.—ED.]

Motor Cycles for Home Service Men.

Sir,—May I through the medium of your paper be permitted to voice a suggestion which many men engaged in the services at home, temporarily or permanently for duration of war, would very much appreciate?

Many are engaged on duties which necessitate running about considerably, and not having the wherewithal to purchase a machine of their own would greatly appreciate the loan of a motor cycle.

There must be a considerable number of machines which have been rejected by the War Office as unfit for further use in the war zones, which at a small cost could be put into running order.

If the War Office would sanction the loan of these machines, anyone who might be allotted the use of one would repair it at his own cost and return it at the end of the war.

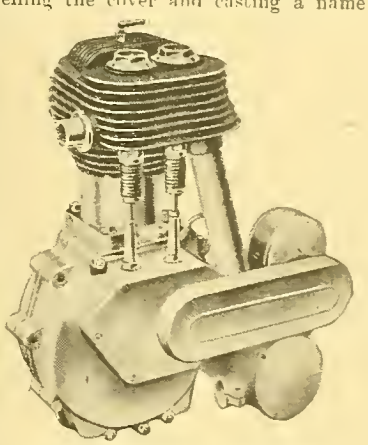
Personally, it would give me great satisfaction to be granted the use of one on these conditions.

CHIEF PETTY OFFICER, R.N.V.R.

Engine Design.

Sir,—In the course of your remarks *re* next year's models in a recent issue, you say, "There are infinitely too many nooks and crannies, especially on the engine, which harbour the dirt"; also, "Bearings are too small for the loads they have to carry." Now whilst there is always room for improvement—and the intelligent section of manufacturers will always welcome suggestions for such—it is, nevertheless, an extremely difficult matter to point out where, or rather how, improvement may be made in the parts mentioned, at any rate in some engines.

Generally speaking, the crank case is an offending member, and the custom of panelling the cover and casting a name and various webs, rings, etc., in prominent relief is to be deprecated. In many cases this is undoubtedly done for appearance sake, but the accompanying illustration surely proves that appearance need not suffer, and is, in fact, enhanced by a clean and smooth exterior.



The clean crank case of the Norton engine. (See letter from the maker on this page.)

It will be noticed that in the Norton engine there is a total absence of interstices for the lodgment of dirt, that all corners are radiused and edges rounded; in addition, all cover screws are sunk flush with the case, so giving a perfectly flat surface.

Regarding small bearing areas, so long as manufacturers adhere to narrow crank cases, cramped timing gear cases, and internal cams, with their necessarily narrow faces, small rollers and smaller shafts, adequate bearing dimensions will be difficult of realisation.

In the engine mentioned external cams are fitted, having a total bearing surface for the ½in. rocker face of 2¼ square inches to each cam, and a camshaft bearing roughly 2in. long by ½in. diameter—considerably larger than many small end connecting rod bearings which take the thrust of combustion; but *area* of bearing is not the sole consideration where durability is concerned. Large bearings may give shorter service in a badly-designed engine than smaller bearings in one of otherwise good design.

The Design of Connecting Rod and Piston.—The strength of piston rings and the design of flywheels affect the durability of bearings, as also does the stroke-bore ratio. A large diameter piston with short throw crank must necessarily subject the bearings to greater load or pressure than a long stroke and small piston with its smaller load, friction (i.e., wear) increasing with the load. This advantage with others of the long-stroke engine must at last be receiving recognition in view of the many models of lengthened stroke now being marketed.

JAS. L. NORTON.

Unlighted Waggons.

Sir,—I am a regular reader of *The Motor Cycle*, and I should like to bring the following complaint to your notice. Every evening after dark I meet A.S.C. waggons in the neighbourhood of Bisley without lights and always in the middle of the road. Surely the Government could provide a light for the leading waggon. We are not allowed head lights, so how can we be expected to see these waggons?

H. J. CANN

Winter Riding.

Sir,—I have noticed your reference recently to the discomforts experienced in motor cycling in winter time, and I write to express my satisfaction with the protection which the Scott machine affords. I use my machine with sidecar constantly throughout the winter for my professional visiting as a clergyman, and find that the protection against mud splashing is perfect so that I can wear ordinary professional clothes. Moreover, the situation of the radiator with the warm air generated by it makes it quite unnecessary, even in the coldest weather, to wear leggings, and the frame allows an overcoat to be worn without any inconvenience.

I have just been realising more and more how admirably adapted the Scott machine is for work such as mine.

(Rev.) HERBERT F. FALCONER.

Duplex Lubrication.

Sir,—Those of us who have read our "Ixion" for as many years as the writer has know the value to be attached to his opinions, but for the sake of the novices, and in justice to a machine which I ride myself, I should like to state that the two-stroke James really does not use "forty-four fluid ounces of lubricant in 100 miles." The measure in the petrol tank holds just three and a half ounces, and it will be found that seven full strokes of the pump are required to fill it. The pump therefore holds half an ounce of oil—not two or three ounces, "Ixion"!

One pumpful of oil per five miles is really a good deal more than the engine wants, but taking it at this figure, the oil consumption will be ten ounces per 100 miles through the pump, and three and a half ounces in the petrol, or thirteen and a half ounces total.

This is about 1,200 miles per gallon, which is quite good for a motor cycle. Surely even "Ixion" would have noticed the effect on his oil bill if he had been using one gallon per 360 miles!

W. WOODWARD.

Four-stroking on Two-strokes.

Sir,—I note many of your readers who own two-stroke machines complain of four-stroking, especially on going downhill. My advice to them would be to try a B. and B. two-stroke carburetter, as my machine is fitted with one, and it is very seldom I can get it to four-stroke. I am sure the carburetter has a lot to do with this nuisance, because a friend of mine has the same make of machine as I have, but with a different carburetter, and it is a chronic four-stroker. I may state that I am in no way connected with this firm, but give my views as a satisfied user.

WILFRED F. GOWER.

Oildag.

Sir,—Some time back "Ixion" wrote very favourably of his experiences with Oildag, and as several of my motor friends swear by it, I determined to try it on my machine—a Scott. I first experimented with the concentrated Oildag mixed with the oil I was then using, and was so delighted with the results obtained that I decided to go in for Oildag all ready mixed for using, as supplied direct by the Oildag people. My hopes have been more than realised, and one has only to try this wonderful oil to become a confirmed Oildagger, and to know, what "Ixion" so aptly terms, "silky" running. Less oil is required, and yet, after a long solo "blind," or a long pull up a bad hill with sidecar attached, my engine keeps as cool as ever. I have just taken my engine down after 3,000 miles on Oildag, and, apart from carbon deposit, everything is in perfect order.

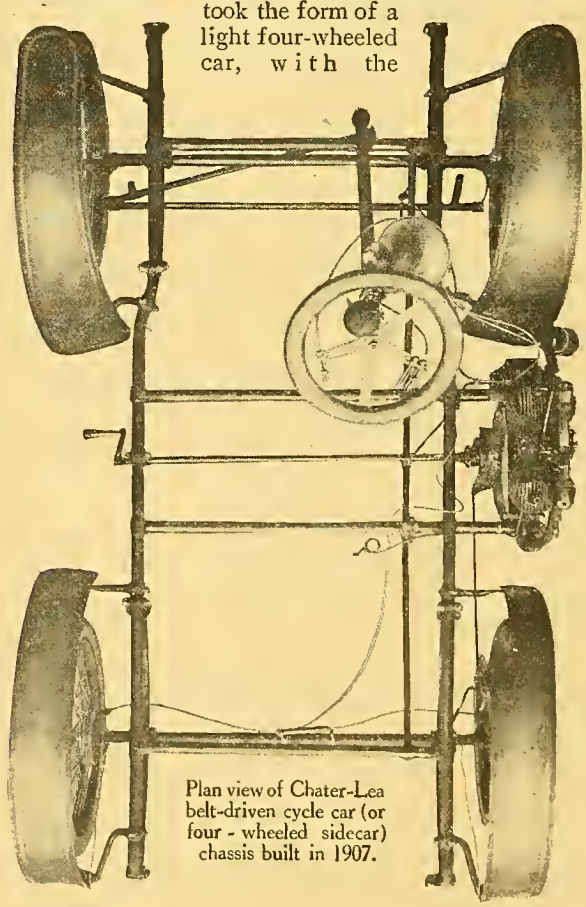
PERCY WAITE.

[MANY OTHER INTERESTING LETTERS ARE UNAVOIDABLY HELD OVER UNTIL NEXT WEEK.—ED.]

A NINE-YEAR-OLD CYCLE CAR.

The Chater-Lea Carette—a Forerunner of the Modern Double-seated Sidecar.

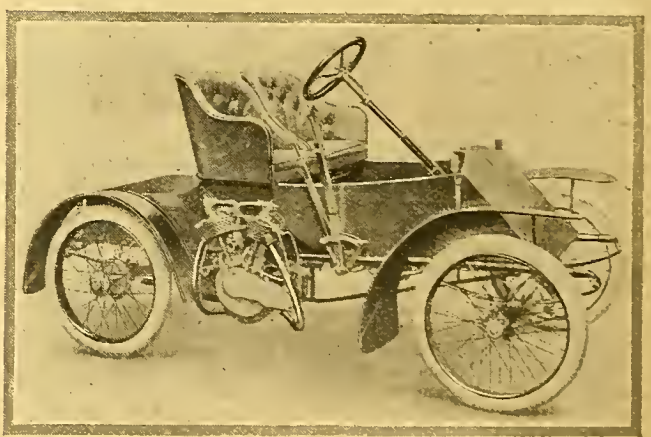
IN these days when economy is a very considerable item in all things, especially motoring, the man requiring a passenger-carrying outfit would think twice before purchasing a full-blown car, whereas the vehicle incorporating the economy of the sidecar outfit with some of the comforts provided by a light car, especially so far as the points of cleanliness and weatherproofness are concerned, would in all probability attract his attention. The advent of the new Scott three-wheeler undoubtedly opens up a new field in this direction. At first it would appear that this is an entirely new type, but by looking back nearly a decade we find a very similar machine in the Chater-Lea carette. This machine was first experimented with in 1906, was quite one of the simplest forms of light car, and was certainly the forerunner of the cycle car, which had a "boom" a year or so ago, when it was supposed to be an entirely new type. The first Chater-Lea carette appeared on the road in 1907. This took the form of a light four-wheeled car, with the engine, a twin-cylinder Sarolea, fitted at the side. If we take away the off side front wheel, we have practically a double-seated sidecar, with the mechanism delightfully accessible. The drive was by means of a belt to the right-hand rear wheel, and a variable gear and free engine were obtained by means of an expanding pulley operated by a single lever. The body, springing, steering, and brakes followed car lines, the springs being semi-elliptic, the steering by wheel, and the brakes internal expanding.



Plan view of Chater-Lea belt-driven cycle car (or four-wheeled sidecar) chassis built in 1907.

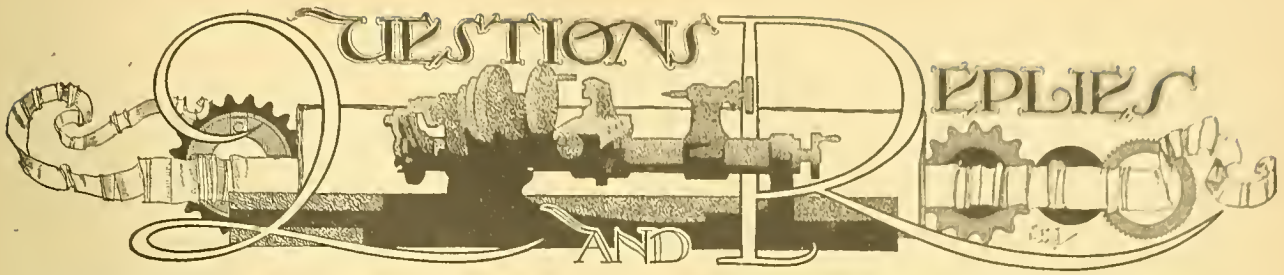
A Chain-driven Model.

This machine proved perfectly satisfactory, and in 1908, the following year, a model was produced incorporating chain drive. The drive was carried across the frame by shaft through a two-speed gear box, whence it was transmitted by chain to the near side rear wheel only, so obviating the necessity of a differential gear. This model was driven by Mr. Chater-Lea in the London to Edinburgh trial of that year, in which it ran most successfully. However, cycle cars or light cars were not in public favour at that time, so Messrs. Chater-Lea decided to turn their attention to the powerful twin-cylinder cycle and sidecar combination, with three speeds and chain drive. This outfit was placed on the market in 1909, and was the first sidecar combination to complete the London to Edinburgh trial.



An early model cycle car—the chain-driven Chater-Lea built in 1908, and which successfully completed the London-Edinburgh run of that year.

The experiments with the cycle car were abandoned at the end of 1908, as Messrs. Chater-Lea were convinced that if a motorist decides to abandon a sidecar outfit in favour of a car, a car in every sense of the word is what he desires. Therefore since 1912 they have devoted their attention to light cars in preference to cycle cars.



A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, London, E.C., and whether intended for publication or not **must be accompanied by a stamped addressed envelope for reply.** Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

Magneto Lighting Set.

I shall be much obliged if you would give me some advice as regards the use of the Dynalite lighting system. I bought one of these instruments a month ago and have had no success with it up to the time of writing, as I have not been able to get a bulb (miniature screw type) that will stand the current. Perhaps some of your readers have had experience with this system.—C.G.C.

We should think you are using lamps of too low voltage, you might try a lamp of, say, six or eight volts. It is possible that you might not get so good a light at low speeds, but it would be less likely to burn out at high. With these small magneto lighting dynamos the voltage rises rapidly when first rotated, but as the speed gets above a certain number of revolutions the voltage does not increase to any great extent; it would, therefore, appear as though a slightly higher voltage lamp would stop the trouble of burning out. The usual run of small screw bulbs as sold for flash lamps, etc., are barely four volts, and even with a four-volt accumulator are apt to burn out readily. You want to be careful to obtain one of good make, and be sure the voltage is at least two volts higher than at present fitted.

Magneto Conversions.

I have a single-cylinder machine which is not powerful enough for sidecar work. My magneto is a U.H. 50° twin. I have thought of buying a bicycle with a 6 h.p. twin engine, with cylinders at an angle of 90°. (1.) Is there any means of altering the magneto from 50° to 90°, and by what method? Also, what would be the approximate cost? (2.) Would it be practicable to obtain a fresh crank case for the present cylinders, pistons, etc., say, from the makers of the engine, to bring the angle to 50°? (3.) Which of the two alternatives would it be best to adopt? (4.) What is the correct procedure for adapting a twin magneto to a single-cylinder bicycle, and does it in any way affect the magnetism or injure the armature with the one point not firing?—W.H.B.

(1.) No, it is not possible to alter a magneto of 50° to make it suitable for an engine of 90°, as the construction of the two is absolutely different. (2.) It would, of course, be possible to have a new crank case made to alter the angle of the cylinder, but it would mean practically rebuilding the entire engine, and would be extremely expensive. (3.) It would be far more satisfactory, and, in fact, is the only really practical method, to purchase a proper magneto for a 90° engine; this would also be cheaper than the conversion. (4.) All that is necessary to convert a twin magneto to a single is a new contact breaker. It would not injure the magneto, as with a single-cylinder contact breaker the second high-tension current is not generated.

Starting a Big Single.

I have a 4½ h.p. (650 c.c.) 1914 single with three-speed hub gear and heavy coachbuilt sidecar, Bosch magneto, Senspray carburetter, and kick starter. I find it quite impossible to start on the kick when cold, and I have often had to run 100 yards. I usually have to get someone to push. The machine runs well when warmed up, and will then start readily enough on the kick. I have just taken down the carburetter and cleaned it, and the magneto also seems right. In summer I use Motorine A, and now Huile de Luxe, summer grade. These are the oils Messrs. Price recommend. Can I safely put in a lighter oil in winter than the Huile de Luxe summer grade? And would this oil do for summer? I presume they recommend these heavy oils, since it is a big cylinder. An injection does not help much, for if I can only get sufficient "way" on the machine it will start. If you can give me any advice that will enable me to start more easily I shall be much obliged.—E.H.B.

If you look at all the following adjustments you should experience no difficulty in starting; the machine should start from cold with not more than half a dozen kicks. See that the contact breaker points are clean and are separating about .4 mm. Make sure the rocker arm is not sticking. The carbon brush should be clean and quite free from oil. The plug should be clean and free from oil; have the points adjusted about $\frac{3}{32}$in. apart. You might try an absolutely new plug; the one you are using may be faulty. See that the valve tappets are correctly adjusted; when the engine is cold there should be about ½ mm. to $\frac{1}{32}$in. clearance. Make sure there are no air leaks in the induction pipe between the carburetter and engine; to ensure this you might bind all joints with adhesive tape. Make quite sure all passages in carburetter are free. Directions for starting: To free engine in cold weather, inject a little paraffin or petrol through compression tap, and turn the engine over a few revolutions to let it work past the rings and thin the congealed oil. If the carburetter is any but a Senspray, flood it well; if Senspray, only depress the needle valve once or twice. In most cases it will be found best, in order to obtain an easy start, to set the levers as follows: Spark fully advanced or nearly so, throttle quarter open, air fully shut. Do not give too much throttle; it will sometimes be found an advantage to shut it completely and then suddenly open it while pushing. You might also make sure the valve springs are strong enough; weak springs sometimes cause bad starting. Price's Huile de Luxe winter grade would be quite suitable; it is always best to use as heavy an oil as possible. We think if you check all the above adjustments you should have no further difficulty in starting.

The Effect of Wet.

On one or two occasions lately I have been compelled to leave my machine, a lightweight, standing in the rain for upwards of a quarter of an hour, after which I find considerable difficulty in getting a start. Usually this machine will start off at the first push, but under these circumstances I have to run with it till I am almost exhausted; I mean while it is spluttering and exploding in a most bewildering fashion. Can you please tell me what it is that is affected by the rain? I am only a novice, this being my first mount, so if my question seems rather crude you must excuse me on that account. The machine is fitted with B. and B. carburetter and Dixie magneto, and starts and runs beautifully when dry.—J.L.

The trouble is probably due to moisture on the plug or high-tension wire, which would cause either a total or at any rate a partial short circuit, which would cause bad misfiring. If you have to leave the machine in the wet it would be a good plan to cover it with a light waterproof cover, so as to prevent the water from getting on the plug, high-tension wire, or magneto.

SPECIAL NOTICE.—*Copies of "The Motor Cycle" may only be sent to neutral European countries if posted direct from the offices of the publishers, or by newsagents who have obtained permission from the War Office for this purpose. The publishers of "The Motor Cycle" have obtained the necessary permission, and, consequently, can send subscribers' copies as usual. Before sending through newsagents it is important to enquire if permission has been obtained as otherwise copies intended for neutral European countries will not be forwarded by the Post Office.*

Faulty Contact Points.

[?] I have a B.S.A. motor cycle with C.A.V. magneto, which misfired occasionally, and on examining the contact breaker points I found them burnt or worn unlevel. I filed them flat, and after running ten miles misfiring again began. I tried adjusting, with still the same result, and finally put some oil on the points. After that it fired properly for another ten miles, and then again started misfiring. I applied more oil, and was all right for another ten miles, and then commenced misfiring. I have done this several times, with the same result.—J.H.R.

Your trouble is evidently due to the contact breaker points being at fault. You should make sure that the points are either pure platinum or one of the special metals sold for this purpose. You should also make sure they are perfectly flat and meeting absolutely squarely, then adjust them to separate exactly .4 mm., which would be, roughly, the thickness of a stout visiting card. If, after doing this, the points still burn or pit and give trouble, it is probable that the condenser of the magneto has broken down, and you should send it either to the makers or some reliable firm of magneto repairers to be overhauled.

Running on Paraffin.

[?] (1.) Is there any reason why paraffin should not be used in place of petrol in my two-stroke? I have tried paraffin, and found that when once the engine was warmed (which was done by filling the float chamber with petrol and running on this to start) it ran and seemed to have the same power as if petrol were being used. Perhaps it did not accelerate quite so quickly, but the plug was not sooted, and the only difference I found was that the engine was much freer after standing overnight. (2.) Which is the best method of getting the top piston ring loose? This ring gets absolutely stuck long before the engine requires cleaning. (3.) Please tell me the best method of removing carbon from the inside of the piston. The gudgeon pin has never been out, and I am afraid that it might now be difficult to remove it.—PETROIL.

(1.) Paraffin does not give so much power as petrol, and it tends to foul up the engine. Of course, most engines will run on it after being warmed up on petrol. There is also a tendency for the engine to knock badly. It also makes a mess, as it creeps everywhere, and, of course, dust collects. It is better to use a mixture of petrol and paraffin—about two parts petrol to one part paraffin. (2.) When a piston ring has stuck as badly as this, there is nothing to do but dig it out, generally speaking, in pieces. The small blade of a penknife is perhaps the most suitable tool for this purpose. (3.) Use a blunt screwdriver for removing the carbon from the inside of the piston. Special tools for removing the gudgeon pin can now be obtained. Take care to remove it the correct end.

DESPATCH RIDERS IN THE MAKING.—A group of R.E. men, all Douglas mounted, in training at a depot in the South of England.

READER'S REPLY.

Cover Blowing Off.

I have just read in *The Motor Cycle* of December 2nd your correspondent "P.E.'s" letter (page 570) with regard to cover blowing off, and thonght possibly a similar experience of mine might be of some use to him. About six months ago I bad occasion to renew the cover on the back wheel of my 3½ h.p. motor cycle, so purchased an extra heavy Dunlop cover. Much to my disgust, it blew off after it had been on about five minutes. I may state here that its size is 26×2⅜in., fitted to a 2¼in. rim. Previous to this I had been using Kempshall covers of the same size. Nothing daunted, I re-fitted it, thinking perhaps that on the first occasion the bead was not quite home, though from all outward appearances it was perfect. This time it blew off while I was pumping up. On each occasion it came off between the security bolt and the valve. I next took the wheel and tyre up to the Dunlop people, who informed me that my rim was an odd size (date of machine 1913½), there being a difference of ⅛in. in width between mine and their standard, and that also the beading on mine was much too small. I must say at the time I was rather doubtful that this slight difference was the cause of the trouble. However, I purchased one of their rims, and built it into my wheel and re-fitted tyre, and from that date to this it has been in perfect condition; as a matter of fact, it has only been pumped up twice in six months The only reason that I can account for the Kempshall tyre keeping on the small rim is that it is what I call a "stiff" tyre compared with a Dunlop, *i.e.*, will stand up and keep its shape when off the rim, whereas a Dunlop will not.—M.W.T.

EXPERIENCES WANTED.

"P.M.D." (Brighton). — T.D.C. De Luxe lightweight. Reliability, maximum speed, and consumption.

"C.A.H." (Bexhill).—3 h.p. Enfield. Consumption and speed, reliability, ease of starting, lubrication, and gear. Results fitted with Binks carburetter.

"A.C.R." (Middlesex).—Grado-multi pulley for fitting to 2¾ h.p. twin. General efficiency and belt slipping on low gear.

"A.D.P." (Bury St. Edmunds).—3½ h.p. Norton with Philipson pulley. Flexibility at slow speeds. Also 3¼ h.p. Brough. Behaviour of overhead valves.

RECOMMENDED ROUTES.

ARUNDEL TO HASTINGS.—R.C.

Arundel, Broadwater, Shoreham, Brighton, Lewes, Ringmer, Horsebridge, Ninfield, Bexhill, St. Leonards, Hastings.

LIVERPOOL TO IPSWICH.—W.D.E.

Liverpool, by ferry to Birkenhead, Chester, Nantwich, Woore, Pipe Gate, Stone, Weston, Rugeley, Lichfield, Tamworth, along Watling Street through Atherstone to Lutterworth, then through Husbands Bosworth, Market Harborough, Kettering, Thrapston, Huntingdon, Godmanchester, Cambridge, Linton, Haverhill, Cavendish, Sudbury, Hadleigh, Ipswich.

MOTOR CYCLES FOR SALE.

A.J.S.

6h.p. 1916 Model A.J.S. Motor Cycle de Luxe, fitted superbly, having 3-speed gear and clutch drive, only delivered by manufacturers last week to the order of an officer on leave; having suddenly to return to duty, he offers this machine, which cost £88, for £77/10.—Officer, c/o Motor Supply Co., Chard. [7892

Alldays.

ALLDAYS Matchless, 3½h.p., fixed gear; £22/10.—Buckingham, 21, Tindal St., Chelmsford. [7701

ALLON, 2-speed, clutch, lamps, speedometer, electric horn, done 800 miles; £38.—Carter, 45, Murdock Rd., Haudsworth, Birmingham. [X7452

ALLONS.—We have five models in stock; deferred payment and exchanges entertained.—Lamb's, 151, High St., Walthamstow, and 50, High Rd., Wood Green. [7687

NEW Allons, 2-speed models £42, single-speed models £34; delivery from stock; cash or extended payments.—Wauchope's, 9, Shoe Lane, London. [X7550

ALLDAYS, 6-8h.p., 1915, 3-speed gear box, kick starter, coachbuilt, indistinguishable from new, guaranteed fully equipped, scarcely soiled; 55 gns.—Percy and Co., 337, Euston Rd., London. [7758

1915 Alldays Allon 2-stroke, 2 weeks old, done 200, rear drive speedometer, in perfect condition, better than new; a good, cheap lot, £30; easy payment arranged.—Jones, Tho Broadway, Muswell Hill, N. [7875

Ariel.

1913 Ariel, 3½h.p., 3-speed, Canoelet sidecar, excellent running order; bargain for quick sale, £38.—Sergt. Wilson, 64a, Clarence St., Lancaster. [X7380

ARIEL, 5-6h.p., 1915, new August, 3-speed countershaft, Montgomery coachbuilt sidecar, perfect condition; £80.—A. Downie, 19, Haymarket Terrace, Edinburgh. [X7373

1912 3½h.p. Ariel, coachbuilt sidecar, 3-speed Sturmey, clutch, lamps, horn, perfect condition; £38, close offer.—Apply, Half-moon Garage, London Rd., Croydon. [7789

1915 Ariel, 3½h.p., coachbuilt sidecar, countershaft gear, 3 lamps, speedometer, 2 horns, luggage carrier, Binks carburetter; £60, or nearest.—T. Ball, 108, Linaker St., Southport. [X6966

ARIEL, 3½h.p., 1916, 2 weeks in use, only done 345 miles, 3-speed countershaft, Lucas head light, Watford speedometer, as new; offers invited.—A. Downie, 19, Haymarket Terrace, Edinburgh. [X7374

Under a spreading Chestnut tree
A mournful Cyclist stands;
A very "fed up" man is he,
With black and greasy hands;
For his troubles with the engine parts
Seem endless as the sands.

And children coming home from
A dozen strong or more; [School
Just love to get between his legs,
They want to "hear it roar."
He knows alas that burning sparks
Will fly from plugs no more.

Toiling—grousing—sorrowing,
One thing in life he knows;
Next morn will see a task begun:
To Godfrey's shop he goes
And buys a Power Plus INDIAN
Before the evening's close.

Week in, week out, from morn till
You can hear his engine roar, [night
You can see him swing his trusty bike
At speed up one in four—
And the Village Blacksmith died
with fright
As he stood at his smithy door.

We are more than sorry that the exigencies of rhyme compel us to deprive the Village Blacksmith of the night's repose awarded him by the gentle Longfellow long before the advent of the Power Plus Indian. We are sure that the Village Blacksmiths of to-day (if there are any left) will be proof against the phenomenal speed of the Power Plus Indian flashing past their smithy doors; especially when they learn that it is just as easy to ride this wonderful machine with "measured beat and slow" as it is to attain a speed which it would be unwise to mention.

Godfreys.

The **Power Plus Indian**

is the finest motor cycle yet offered to the Motor Cycling Public.

WE MAKE CERTAIN OF FORWARD RELIABILITY

—leave nothing to chance. EVERY Forward Plug is tested for sparking and leakage under a pressure equal to double that of any engine. The insulator will not crack or break even under terrific heat. The Forward combines every merit required in a spark plug—with the absence of any faults.

TYPE B.

3/- each

Whenever a rider puts Forward Plugs in his engine he reduces trouble possibilities to a minimum.

Every time an Agent sells a Forward he makes a friend.

Satisfaction and Sales — go hand-in-hand. —

TYPE T.T.

3/- each

Tames the worst "plug abusing" engine.

THE Plug for two-strokes.

FORWARD MOTOR CO., Summer Row, B'HAM.

The "IVY" Two Stroke

Programme for 1916

The IVY—during the year 1915 has maintained its splendid reputation, and we are assured by letters from our clients that the little machines are giving every satisfaction. We take this opportunity of thanking those past and present riders of the IVY Two-stroke, whose kind patronage has enabled us to put before the public the aristocrat of its type, and to assure potential purchasers that for 1916, although only improved in detail, it is better than ever.

We are retaining all the models which have been such a success last season, viz.:—Tourist, De Luxe, and Lady's two-strokes, with or without 2-speed gears, and are introducing one new model—a 3 h.p. two-stroke (70 x 90) single-cylinder, which will be sold as a solo machine, and with a sidecar as a lightweight combination. This latter, however, will not be ready for delivery before February, 1916.

Tourist Model Fixed engine **£29 10**
2¼ h.p. (64x70)
Solo Machine. 2-speed **£36 0**

De Luxe Model Fixed engine **£34 0**
2¼ h.p. (64x70)
Solo Machine. 2-speed **£40 10**

Lady's Model Fixed engine **£31 0**
2¼ h.p. (64x70)
Solo Machine. 2-speed **£37 10**

3 h.p. single-cylinder two-stroke, 70 x 90 bore and stroke. Solo machine, and with sidecar as combination, with or without 2-speed gear. Prices not yet fixed; deliveries cannot be commenced before February, 1916.

WANTED.

WANTED, Bat, or other good frame, forks, tank, combined.—Full particulars, Santa Cruz, Sandown Rd., Belfast. [X7623

WANTED, motor cycle, with or without sidecar; cheap spot cash.—Letters, Box 9,824, *The Motor Cycle* Offices, Coventry. [X7598

WANTED, semi T.T. bars, fixed rear wheel carrier and mudguard, for 1910 Triumph.—Springett, Billericay, Essex. [7721

WANTED.—Will give £80 for late 1915 model 11J Harley-Davidson motor cycle.—R., 12, Formosa St., Paddington, W. [7868

ARMSTRONG or Sturmey-Archer Gears or gear parts bought for cash.—Motorist, 33, Lingard Rd., Northenden, Cheshire. [7641

BEAUFORT Garage buy or sell any make motor cycle.—97, Drayton Gardens, South Kensington. Tel.: Kensington 734. [7796

WANTED, N.S.U. 2-speed gear, incomplete or out of order not objected to.—Box 9,828, *The Motor Cycle* Offices, Coventry. [X7586

WANTED, any number of motor cycles and combinations, for immediate cash.—Percy and Co., 337, Euston Rd., London. [7760

SECOND-HAND Motor Cycles, purchased for cash. Send particulars and lowest prices.—Service Co., 292, High Holborn, W.C. [0679

CYLINDER and Piston, 3½h.p. Triumph, 1907 model; state price and condition.—Box 9,801, *The Motor Cycle* Offices, Coventry. [X7160

N.S.U. Gear for 4 H.C. J.A.P., Bowden countershaft gear for 4-cyl. J.A.P., 1914 2-speed lightweight.—S. Reeves, Ashton-in-Makerfield. [X6188

WANTED, modern high-powered combination, cheap for cash, Indian or A.J.S. preferred.—Box 9,825, *The Motor Cycle* Offices, Coventry. [X7508

MAGNETOS Wanted, second-hand or new, any condition, for cash; best prices given.—Parrie, 13, Hardwick Rd., Chiswick Park, London, W. [1429

WANTED, immediately, second-hand sporting canoe-let Scott, purple finish, good condition.—Box 9,817, *The Motor Cycle* Offices, Coventry. [X7379

WANTED or Exchange, 50/- and new 3-jet Binks for N.S.U. adjustable gear, suit 3¾h.p. Precision.—Valentine, 48, Blackscroft, Dundee. [X7643

1914 A.J.S. 2¾h.p., etc., part exchange O.K. Junior, 1915, 2-speed, J.A.P. engine, cash adjustment.—Box 9,826, *The Motor Cycle* Offices, Coventry. [X7582

WANTED, magnetos, carburetters, speed gears, parts, tyres, lamps, motor cycles, engines, plugs, etc.—Cooper, 1, Stroud Green Rd., Finsbury Park, London. [7865

WANTED, second-hand Triumph parts, handle-bars excepted.—Full particulars, lowest price, Box L319, *The Motor Cycle* Offices, 20, Tudor St., E.C. [7732

200 Bicycles, motor cycles, light cars wanted for sale and purchase at once.—Motor Auctions, Eden St., Hampstead Rd., N.W. 'Phone: Museum 2949. [7678

WANTED, good second-hand lamps, horns, speedometers, and other modern accessories.—Particulars and lowest price for cash, Service Co., 292, High Holborn, W.C. [0743

EAGLES and Co., 275, High St., Acton, will purchase second-hand motor cycles for immediate cash; also N.S.U. 2-speed gears in any condition.—Tel.: 556 Chiswick. [X7585

PISTON, with rings and gudgeon pin complete, dimensions 66 mm.×62 mm. high, 25 mm. from centre of gudgeon pin hole to top of piston.—Wm. Mack, Victoria Place, Harthill, Lanarkshire. [X7646

WANTED, 28×3in. Indian tyre, fit 750×75 rim; wind screen and hood, complete, to fit Mills-Fulford Indian sidecar; long drive Indian chain; 28×1½ gent's cycle 3-speed wheel, complete, to fit Newton frame; approval; lowest cash.—2, Egton Terrace, Birtley, Co. Durham. X7477

SEND Your Motor Cycle to Palmer's Garage, Tooting (Wimbledon Station L. and S.W. Railway per goods, or Tooting Junction passenger train). Cash offer will be telegraphed immediately on receipt of machine. Machine can be included in fortnightly auction without charge, if offer not accepted. Reserve price may be fixed.—Sole address, Palmer's Garage and Motor Cycle Auction Rooms, 183, 185, 187, 189, High St., Tooting. [7835

WANTED, any number of solo motor cycles, combinations, cycle cars, light cars, magnetos, speed gears, speedometers, carburetters, etc. We purchase suitable machines for cash, exchange, or sell on commission. Send us particulars; many clients on waiting list. Being one of the world's largest motor distributers, we have the largest clientele, and obtain and give the highest prices. Valuation, tuition, insurance. Low cost.—Morgan and Maxwell (Established 1893), The London Motor Mart, 80, High Rd., Streatham, London. [X1252

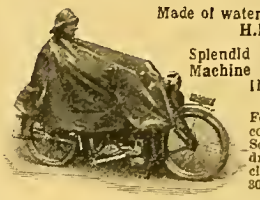
EXCHANGE.

WANTED, piano and cash, for New Hudson combination.—Johnson, White Swan, Mountsorrel. [X7157

EXCHANGE Propositions considered; write me (see Cycle Cars).—Liquidator, 10c, Waylett Place, West Norwood. [X7618

ROGAN'S ALL-WEATHER

MOTOR CYCLE CAPES



Made of waterproof as supplied to H.M. NAVY.

Splendid COVER for the Machine IN THE WET or IN GARAGES.

Folds up into a small compass, 9x6x2 ins. Something to keep you dry and the dirt off your clothes. Weight only 30 ounces.

A FEW POINTS ABOUT IT.

Cover the machine when rider is off. Can be carried easily by all Motor Cyclists. Can be rolled up any way. Can be put on any machine in half-a-minute. Does not blow up when riding. Does not crack or get sticky. Does not perish like rubber. Does away with half accessories. Dirt can be washed off with a sponge. No extra thick clothing required. No thick gloves. No chest protectors. It is light and portable. It is wind and rain proof. It keeps the machine dry.

PRICES—MOTOR CYCLE CAPE, in Black or Khaki 22/6. LEGGINGS, Slip on 5/-. SOU'WESTER HAT, Cloth Lined 2/9. LADIES' HOOD, Silk Lined 5/-. SIDECAR CAPES 15/-.

Sent on approval against cash. Money refunded if not satisfied.

J. ROGAN,

Twin-cylinder Two-strokes.

NOW that twin-cylinder two-stroke engines are coming to the fore it may be profitable to consider some of their peculiarities and the difficulties which have to be overcome by designers. The engine with side-by-side cylinders and cranks at 180° presents no new problem, the balance is excellent, and the firing intervals are equal. Thus the torque is as good as is possible with the number of cylinders in question; equivalent, in fact, to that of a four-cylinder four-stroke. It is when a designer takes in hand a V twin or horizontally-opposed engine that new considerations arise.

Considering first the V twin, it is obvious that a single-throw crank such as is used on a four-stroke for the torque and firing interval would be but little better than on a single-cylinder. If the angle between the cylinders were 50°, the firing intervals would be in the proportion of 5 to 31 as compared with the intervals, or 41 to 31 (approximately 4 to 3) on a similar four-stroke engine. To obtain even firing, one piston must be at the bottom of its stroke when the other is at the top. Thus in the 50° engine before mentioned the crank which carries the front connecting rod must be 130° in rear of the other, and the balancing of such an engine would be something of a problem in itself.

Turning now to the horizontally-opposed twin with cranks set at 180°, which is so effective as a four-stroke, we find that, while the balance is practically perfect, except for a longitudinal couple due to the cylinders being slightly offset, the firing is equivalent to that of the same engine in its four-stroke form—even, it is true, but in no way superior to the torque of a two-stroke single, namely, one explosion per revolution. This is brought about by both cylinders firing at the same time. To obtain even firing when the explosions are separated one crank must be used, and we at once lose one great advantage of this type of engine, viz., its excellent balance, and revert to the balance of a single-cylinder with a double set of reciprocating parts.

Dispensing with Magnetos.

IT is interesting to consider the future of ignition systems on motor cycles, and the possibility of magnetos sooner or later being dispensed with entirely. Such a suggestion will come as a shock in many quarters where magnetos, by reason of their excellent design and results, have given entire satisfaction, and have proved to be, probably, the most reliable portion of the trustworthy modern motor bicycle. With the growing adoption of dynamo lighting on motor cycles as well as on cars, two entirely separate electrical systems are coming into use, when a properly designed single unit system would suffice. In many cases modern cars have three distinct electrical systems, but there is now a natural tendency to embody these in a single unit system. Thus we find a motor generator which not only starts the engine, but also keeps the batteries for the lamps properly charged, and the batteries, in turn, provide current for the distributer and coil ignition system. Thus, in a single electrical unit the functions of starting, lighting, and ignition are neatly carried out, the generator being used in place of the three electrical machines used in other designs, viz., the dynamo, the starter, and the magneto. The wiring, it must be confessed, is at present very complex, but there is no real need for this, as the generator, coil, and distributer might well be formed in a single unit. It may be that sooner or later the same system will be adopted on side-car outfits, particularly if these become a standardised form of vehicle, as they promise to do, as opposed to the double purpose detachable outfit. On the other hand, we feel sure that motor cyclists would look upon the elimination of the magneto with considerable pangs of regret, for undoubtedly it has given excellent service, and on its adoption years ago gave the motor cycle the biggest fillip it ever received.

An Index to the advertisements in this issue will be found on the page facing the back cover

Novel Speed Judging Test in Holland.

Regularity Trial of the Motor Club Noord-Holland.

Scene at the starting point of the Dutch regularity trial. A number of British machines competed and secured awards.

A FEATURE of the speed-judging test, held on the 12th inst. by the M.C. Noord-Holland, was the method of checking employed. A circular course was chosen and competitors divided into two groups, each departing in an opposite direction. There were coloured signals—two of each colour, one in one group and the other in the second group. When the competitor in the first group met the competitor in the second group carrying the same coloured signal they both stopped and noted each other's time on their time cards. There were also two controls.

The weather was not at all favourable, and the roads were bad. However, twenty riders put in an appearance, and British and American machines were prominent. For most of the run the road followed canals, and, as will be gathered from the pictures, the roads were heavy and slippery. Fortunately, nobody drove into the canal—an actual happening in one Dutch trial some little time ago when the event had reached a stage of great excitement. There were two teams, each consisting of two solo and one sidecar outfit, from the North Holland and South Holland clubs. A. Citroen, secretary of the organising club and a rider whose name is familiar to many of our readers, was a member of the Noord team, and rode a twin-cylinder Simplex. He did well, winning a silver medal. Four riders gained premier awards, *i.e.*, silver medals, and these were mounted on Simplex, J.H., James and sc., and Vulkaan machines. Two bronze medals were awarded to riders of Triumph and Reading Standard machines.

Holland is now the nearest country in which civilian motor cycle competitions are possible. For this reason more interest is attached to the doings of our Dutch friends than might be in times of peace, though we always welcome any news from that country.

At a control in the Dutch trial, a report of which appears on this page. Note the reflections in the canal.

Drilled Countershaft Pulleys.

I have never personally suffered from belt slip on the countershaft pulley of a combination drive, except when the belt had stretched so appreciably that shortening was essential; my experience has been that a taut belt grips a pulley of this size quite firmly, even when there is a lot of water about. However, I was recently examining a machine belonging to an indomitable all-weather fiend, and I noticed that his countershaft pulley was drilled. On this particular make of machine the gear box is rather far back, and the arc of belt contact only extends from the seven o'clock to the eleven o'clock positions of a watch dial. In other words, the contact area is very little, if any, larger than can be obtained by using a smaller pulley set further away from the back wheel, as in the direct belt drive, when the arc of belt contact might extend, say, from the 6.30 to the 11.30 positions. Some of our designers have yet to realise that the combination drive requires (*a*) as large a countershaft pulley as possible; (*b*) as forward a position of the countershaft as is possible; and (*c*) a smallish back wheel pulley; that is, if the full benefit of the design is to be secured. When belt slip is experienced with a taut belt, a drilled pulley will be of some assistance.

The Four-cylinder and its Future.

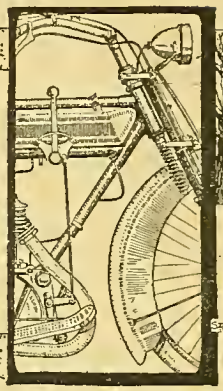
I continue to suffer occasional onslaughts from various correspondents who consider I "damn the four-cylinder with faint praise," and in particular that I have invariably been unjust towards the four-cylinder F.N. Well, I frankly admit that during a long experience of motor cycling, dating back to the very earliest days, I have always regarded the four-cylinder motor cycle engine as the least adapted of all possible designs to the general needs of the average motor cyclist, and my critics should notice that the trade and the public have invariably supported the same opinion with unanimity and force. There has always been a steady demand of a limited character for good examples—formerly the F.N. alone, supplemented latterly by the Henderson. Furthermore, the shaft drive, in the present state of affairs, stands or falls with the four-cylinder engine; it has never really achieved any marked success with any other type of power unit. A clever tuner, with plenty of leisure at his disposal, may be thoroughly justified in enthusing about engines which take five or six times as much keeping in order as a single-cylinder (N.B.—A twin takes more than twice as much tuning as a single, and a four more than twice as much as a twin); in particular, so long as decarbonisation continues to afflict us every 1,000 to 1,500 miles, a heavy engine which cannot be cleaned without being removed from the frame can never become one of the leading popular types, though men of leisure will naturally discount this factor in return for the magnificent running of the first-class four. Mr. Birrell once said that minorities must suffer—it is the badge of their tribe; and until we are all expert tuners with plenty of leisure for tinkering, not only the four-cylinders, but all other comparatively complex types will remain in a minority, however excellently their intrinsic merits may compare with simpler and cruder patterns. For the present, therefore, the four-cylinder enthusiasts form a minority; and their suffering will inevitably take the form of watching the public and the publicists laying heavier stress on the merits of simpler types. When our publishers are multi-millionaires and pension me off, I assure my correspondents that I shall gleefully purchase a regular stud of four-cylinders and begin to enjoy myself. But as long as I work fifteen hours a day and have to effect lightning repairs and adjustments whilst eating up the crowd between two hill-climbs in a Six Days Trial, I must stick to comparatively simple types; and being an honest man, I must communicate my experiences to the general public, whose circumstances are usually parallel, though not identical. Nevertheless, I freely admit that I cannot conceive how a sporting undergraduate, for example, whose sole daily engagement may be a morning lecture, which he generally cuts, can ride a thumping single-cylinder when Hendersons and F.N.'s are obtainable. Is that clear?

Garage-built Cycle Cars.

For some mysterious reason the London suburbs have probably produced more "own transfer" motor cycles than the rest of the world put together; and the output was especially large in the old tricar boom. I resided in London at that time, and whenever one penetrated into the back workshop of the small garage-cum-repair shops, with which the suburbs were dotted, one was pretty certain to find some quaint and gigantic monstrosity of a tricar in course of completion, usually to a customer's design as well as to his order. I doubt whether these freak machines, which were usually of the sporty and speedy order, ever made any serious contribution to contemporary design. But there is no reason why a locally planned and constructed cycle car should not crystallise into a permanent type. The supply of cycle car components is large, and during the coming winter enthusiasts with eighty or a hundred pounds to spend might do worse than attempt to evolve original cycle cars, with the aid of their local repair man. Anything is better than stagnation, and it is very questionable whether the supply of standard bicycles and cycle cars can catch up to the demand until many months after peace returns. The sole alternative in many cases lies in the purchase of some imported mount; and not all the importations can boast Hendee quality, as some light-hearted experimentalists have already discovered to their cost.

TWIN TWO-STROKES.

Some of the Points to be Considered in Designing Twin Two-strokes.

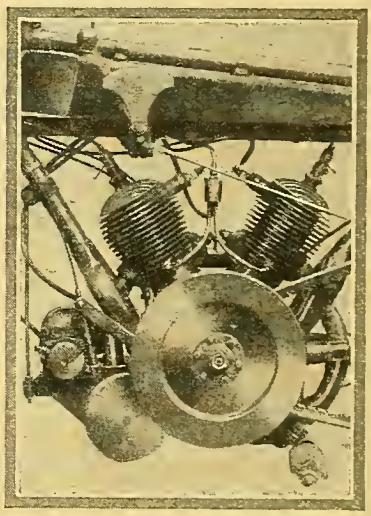


THE majority of motor cyclists seem to think that the two-stroke twin-cylinder engine which is now being experimented with by such a large number of firms can be evolved from standard designs by taking the ordinary two-cylinder motor cycle and altering the castings so that a two-stroke twin is formed. Actually there are a great number of very interesting problems on the successful solution of which the success of the two-stroke machine depends, while the designer gets little or no help from the twin-cylinder four-stroke engines.

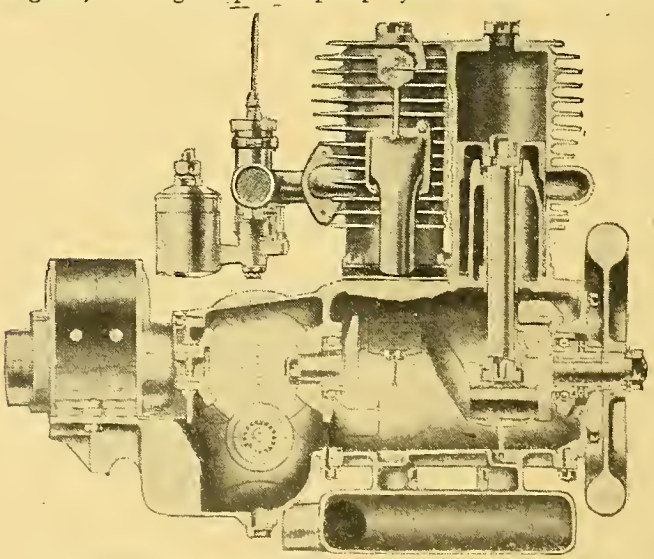
When brought down to representative types, the twin two-stroke is to be found in three forms, namely, the twin upright or inclined side-by-side cylinders, the V, and the horizontally-opposed cylinder design, each having certain advantages and certain disadvantages which have to be weighed very carefully before a decision is made.

The two-stroke twin design is best exemplified by the Scott and Premier, which engines really are separate engines side by side with parallel cylinders and a two-throw crankshaft. Naturally the nature of the crankshaft may vary, since some prefer flywheels within the crank case and the crank itself built up of pins secured to the flywheels, while others employing an outside flywheel have a built-up or solid crank of car type.

Crank case compression is used for these smaller engines, although separate pump cylinders are found when the bore is increased very much, and it is this compressing of mixture within the crank case which is responsible for so much trouble. Actually there is one crank case for the two cylinders, but a diaphragm or wall is cast inside the case to hold the centre bearing of the two-throw crank, and effectually to divide one crank case from that of the other. Obviously more or less lubricant varies the pressure of gas which can be drawn in and forced to the combustion space; obviously, also, the separate compartments must be equally pressure tight, while the casting itself must not warp during cooling. All details, therefore, need very careful attention if an equal charge is to be compressed in each compartment and the engine to run smoothly.



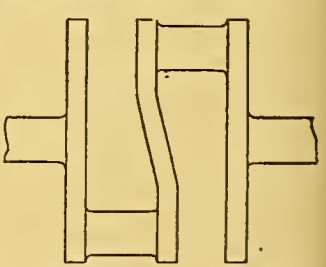
Engine of the V-type twin two-stroke Sun Vitesse.



Part sectional view of the Premier vertical twin-cylinder two-stroke engine.

Even Firing.

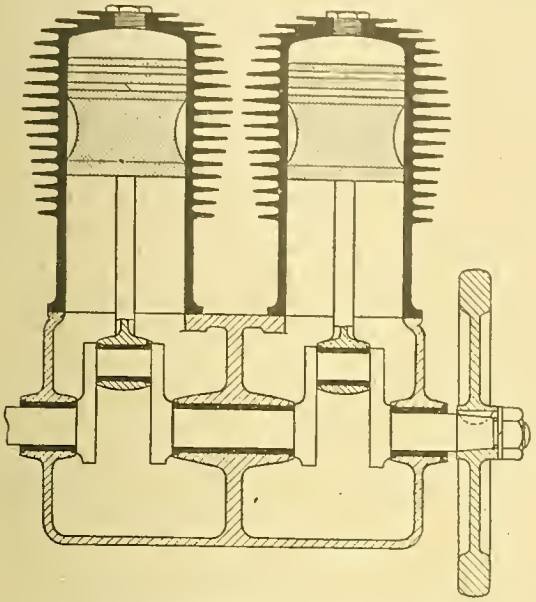
Now to get even firing for a four-stroke two-cylinder engine of this type, the cranks must be set so that both pistons are moving together and reach the top of the stroke together, but the two-stroke cycle makes it necessary to set the cranks at 180°, so allowing one piston to be at the lowest point in its stroke while the other is at the top. Were the four-stroke design to be retained, the engine could still run as a two-stroke, but it would be the equivalent of one very big two-stroke, both charges firing together, while the moving parts



Two-throw crank, so constructed that the opposed cylinders shall be more nearly in line. With this design the pistons reach the end of their travel together.

Twin Two-strokes.—

are as unbalanced as those of the single cylinder engine. In the case where the cranks are at 180°, one cylinder fires as the other finishes its stroke, and the impulses treading on one another's heels, the pull or torque is much more even. But there is a tendency to rock, a tendency best understood if one imagines

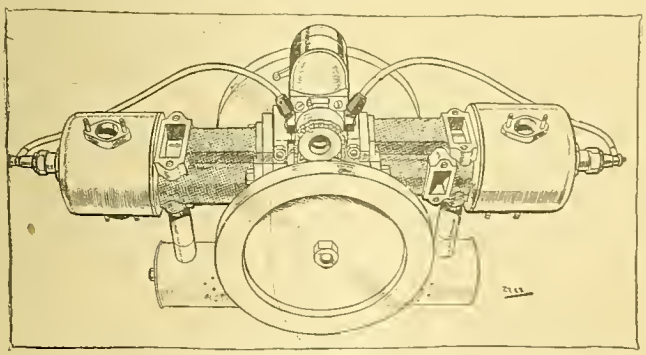


A type of engine in which the cylinders are parallel and vertical, both pistons being at the uppermost positions at the same moment.

the crank case balanced on its centre then one piston pushed down. Obviously the engine would fall to that side, wherefore the frame has to be made to resist this force. If both pistons are pushed down together and equally, the engine would remain steady.

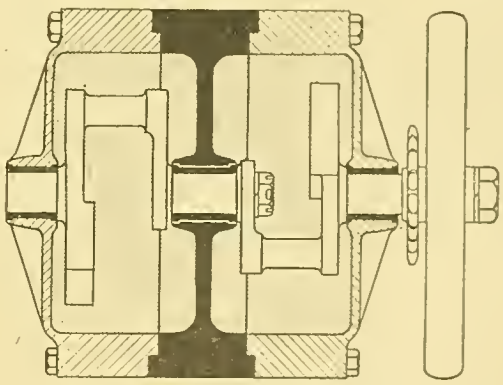
V Twin Two-strokes.

Now as regards the V engine, here we have no point of similarity with the four-stroke V, as once again a partition has to be erected to divide the crank case into compartments, and the utmost care only will prevent leakage through the bearings. As an example, one two-stroke twin has the usual two side plates normally bolted together, but separated by another



Levis twin-cylinder two-stroke engine. The water-cooled cylinders are arranged horizontally, and the cranks are set so as to bring the cylinders as much in line as possible. The pistons move outwards and inwards together.

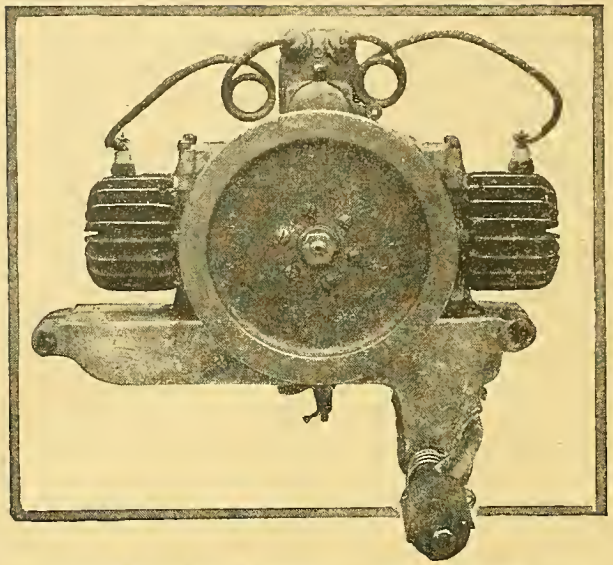
casting, thus making three parts bolted together and with pressure-tight joints. Attached to the additional centre piece is the partition with a bore in the centre holding the centre bearing of the crank, thus dividing the case into two partitions. As it would be impossible to get the crank through this bearing into position, the former is bolted together, the journal (that part of the crank which is in the bearing) having a taper end and a screw thread so that the crank in the next compartment can be secured in place. It is possible to split the partition horizontally, using special means to prevent gas escaping through the joint, so allowing a solid crank to be used and making it possible to place it in position and push down the other half of the partition until the half bearing beds down upon the top of the crank axle. Here again unequal lubrication, leakage, or uneven gas passages from the carburetter will affect the running of the engine. Now with the V-type engine it is necessary to space out the explosions by allowing one piston to be at the top while the other is at the bottom of its stroke. In the four-stroke twin there is but one crank pin and the cylinders are not fired evenly, but in the case of a two-stroke, owing to the separate partitions, the cylinders are out of line with one another, and two pins are necessary. Even then the two pins must be at different positions relative to each other, or the pistons would not be one at the top and the other at the bottom, and even firing would not occur. The angle at which these pins are relative to one another can be set if one knows the angle at



V-type engine crank case, with special piece (shown in black) acting as a wall, and dividing the case into separate compartments.

which the cylinders are set. For instance, with a 50° angle between the cylinders, an angle of 130° between the crank pins is necessary, since this is the only position where one connecting rod is right down while the other is right up. From this it follows that the mechanical balance of a V two-stroke is slightly better than that of a V four-stroke, but, owing to the cylinders being out of line, the same rocking motion is to be met with as was mentioned in connection with the first type of two-cylinder. To make the engine compact, the small end bearing of the connecting rod is not equally on either side of the rod, but all on that side nearest to the centre of the engine, thus allowing the cylinders to be much more nearly in line.

Twin Two-strokes.—



Flywheel side of the twin-cylinder two-stroke Connaught. The platform on which the engine is mounted forms the silencer and also the support for the footrests, the whole unit being secured in the frame by two substantial bolts.

Finally, there is the horizontally-opposed engine similar to the Douglas. Many people know that the Douglas type engine is exceptionally smooth, and this is so because it is well balanced, the pistons moving together and the cranks being at 180°, so that the pistons arrive at the ends of the stroke together. They also know that the centre web of the crank is bent to bring the centres of the cylinders more in line, and to lessen the rocking motion already referred to. If, however, the pistons move outwards together on a horizontally-opposed two-stroke the explosions occur together, and, though the mechanical parts are balanced, the effect would be that of a single large two-stroke. Herein there is the advantage that the engine is as smooth as a four-stroke, and fires as evenly as a two-stroke single, which all will admit is good.

Now, however, comes another difficulty, as this type is difficult to arrange in a frame in such a manner as to be accessible, yet it needs to be more accessible, if possible, because carbon deposit is more apparent.

The twin V looks best and also fits a frame very well, while the twin parallel cylinders can be made up exceedingly well if care is used. So it follows that the twin two-stroke is full of unsuspected difficulties, but since it will be a thing of beauty to handle, when it has even torque and even balance, the battle between the various types now proceeding in experimental shops will be of exceptional interest.

Tyre Repair Patents.

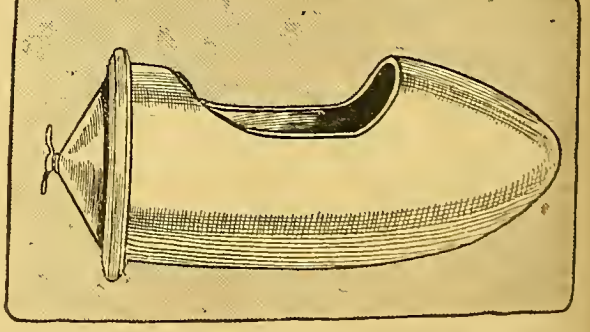
I HAVE received some criticisms of my notes on the Mustikon stud method of repairing inner tubes (*The Motor Cycle* for December 2nd, page 558), the challenge emanating from the patentee of a more orthodox system. My correspondent asserts it is possible to prevent that portion of the tube which underlies a patch from expanding in all directions under inflation by making a patch which is non-elastic in one direction; if the non-elastic axis of such a patch is set at right angles to a split or tear, inflation will not tend to loosen the patch. There is, of course, an alternative system which aims at making the patch and tube equally elastic, so that they expand in the same ratio.

The criticisms continue with statements that (*a*) the lower disc of the Mustikon stud cannot adhere to the inner surface of the tube, because this inner surface cannot be prepared or cleaned, and must be chalky or covered with sulphur; (*b*) that the stem of the plug does not help to seal the puncture, because it can only be inserted if it is a loose fit; (*c*) that the curvature and spring of the outer cup of the stud prevent its being solutioned to the tube over its whole area, and that it can only adhere to the tube by its edges.

All these criticisms are at least exaggerated. I have cut sections of my own Mustikon repairs, and find that the lower disc *does* adhere to the inside of the tube in most cases, seeing that the inflation presses the disc against the tube, and this pressure apparently compensates for the foul nature of the surface. The stem helps to seal the puncture, in my hands at any rate, because I always select a stud which is just too large for the puncture, and stretch the tube to get the stud inserted; I admit a second pair of hands is really desirable for this job, but I have often managed it single-handed. The curved section and springiness of the outer cup do not prevent the whole area of the cup adhering to the tube where the smaller sizes of stud are concerned. I have not yet made a Mustikon repair of a real big gash or split; but I should guess that the cup *might* be inclined to lift where a 3½in. stud was concerned, and I should follow the ordinary rule of pressing such large repairs, *e.g.*, between boards in a vice, wherever possible.

I have only one hint of warning to utter with regard to these handy repair studs, namely, that it is not the easiest job in the world to coax the stud through a hole in the tube, especially when the hole is small.

ROAD RIDER.



WHY NOT? A suggested method of carrying a spare tyre and disc on a disc-wheeled sidecar. The spare disc forms a cover for a capacious locker behind the seat, and at the same time provides a taper.

Testimonial.

Gentlemen, Highgate.
Please send me a Rich Tube. I must mention the one I tried and have in use since 1911 is still acting splendidly, and I am now transferring the present one to the front and fitting a new one to the back. They are a boon.

Third Edition
(Revised and brought up to date)

TRACING TROUBLES

MOTOR CYCLE FAULTS, THEIR IDENTIFICATION AND THEIR REMEDIES, SIMPLY AND FULLY EXPLAINED.

The Third Edition of this handy book for motor cyclists is now on sale.

All obsolete matter has been taken out, and new matter added to bring it up to date.

The Section dealing with Two-stroke Motor Cycles has been considerably enlarged and rearranged.

A new Section dealing with Electric Lighting Dynamos has been added.

Obtainable from—

ILIFFE & SONS, LTD., 20, Tudor Street, London, E.C., and leading booksellers everywhere.

Price, 1/- net. **By Post, 1/2.**

THE Mysterious Sidecar.

By Dr. A. M. Low, D.Sc., A.C.C.I., Sec. Lieut. R.F.C.

IT is said that there is many a true word spoken in jest, and it is certainly quite remarkable from what humble beginnings many fine ideas have started; the same remarks apply to the sidecar. In this article I am suggesting in some short and unscientific notes that the sidecar is not the success that it might be, even considering the huge numbers seen about, and taking into consideration its popularity, its really practical usefulness, both for pleasure and business, and for business of the sterner sort. Yet the sidecar is a strange compromise.

The Birth of the Rigid Sidecar.

In the early days of the movement there were various discussions on the subject of rigid and flexible sidecars; that is to say, sidecars the wheels of which could move relatively to the motor bicycle, which required balancing. Then, as a natural outcome, it struck people that the machine which could stand up by itself without such strange contraptions as wheels on legs which could be pressed on the road by the foot, like the Jack-no-Skid, would be very comfortable, and would be free from risk of sideslip and general danger. The fact that the machine was rigid and would stand still by itself naturally led to it being made more comfortable, and then, suddenly forgetting that the strains which used to be balanced by the *body* of the motor cyclist were being transferred to a few miserable tubes usually bent into extraordinary shapes, designers set to work straightaway to bring out sidecars looking like cabriolets. With the exception of thickening up the metal, little was done to take up strains really scientifically, and, more serious still, to absorb them. In the last A.C.U. Six Days Trial I ventured to criticise severely the fact that rough roads broke up and bent the sidecar outfits, with the exception of one or two which were built up as units, or, in other words, like small cars.

The Stresses to be Considered.

Now, in any design of motor vehicles to be used on the road, there are not only the stresses of weights to be taken into consideration, but there are an infinitely greater series of stresses set up by jolting. Jolting remains to this day the most unsatisfactory part of motor cycling, and yet the sidecar body is often beautifully comfortable. Why is this? Simply because scarcely anyone has attempted to absorb the road shocks of the sidecar frame, since designers have simply made the passenger comfortable by the elaborate springing of his own weight, forgetting that the sidecar chassis often takes enormous shock loads and the large proportion of the stresses caused by the weight of the motor cycle and rider, particularly when the machine is being driven round a corner.

The consequence is that, in order to make the whole outfit stand the strain, we have all sorts of auxiliary stays, claims by the makers for straightness of tubing, and other excellent points; while the whole chassis, including that of the motor bicycle, has to be made strong enough to stand the road shocks and the various side loads imposed upon the whole vehicle, if twisting and straining are to be prevented.

The Sidecar as a Complete Vehicle.

Notice that I refer to it as a vehicle as apart from an attachment, as it can no longer earn this name in many cases. An attachment pure and simple would not throw further strains on a machine other than by absorbing some of the engine power, nor would it be of such a design that it could practically never be detached. Most sidecar outfits of the particularly satisfactory type are simply vehicles, and it is strange to think that with their speed, economy, reliability, half-comfort, and unmechanical appearance—to quote the good and bad points—they still represent one of the cheapest and most satisfactory forms of conveyance known. It is *mysterious* to think that, whereas half a machine is comfortably enclosed and sprung, the unfortunate owner and driver is in the majority of cases, and then only with great difficulty, given any comfort at all, and one is compelled to think that other types of vehicles may in time come in; but I trust not at the other end of the stick, for when we see both passenger and driver in the sidecar, and the bicycle turned into an attachment to the sidecar, instead of the sidecar to the bicycle, it should make us smile or weep—if we are philosophically minded.

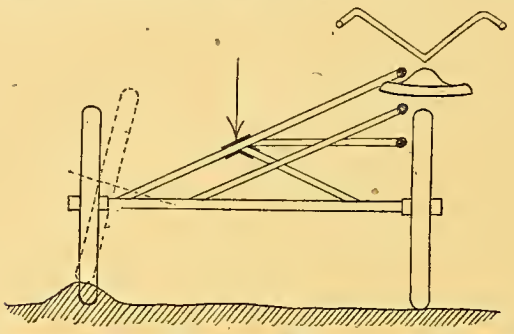
Rigid sidecar outfits are very nice as vehicles if everything is sprung, and the occupants are comfortable, clean, and happy, but I am not wishing to write on these points, as I want to enter a plea for development along the lines on which the original sponsors of the sidecar expected to see progress.

Detachability and Lightness Desirable.

Assume that the sidecar machine steers well, and is already cheap and good, there is little to be gained in having steering sidecar wheels, and similar devices. We will take it for granted that the rider of a sidecar machine is somewhat of a sportsman, and does not mind a little discomfort. If this is so he would surely like to have a free machine which he could sometimes ride solo, and this is one point I wish to labour.

The Mysterious Sidecar.—

I would like to see it admitted that the sidecar is a satisfactory but mysterious monstrosity, and I would like to see it admitted that it is meant, in the case of lighter vehicles, to be a unit attachment. In this case it means that the sidecar must be *very* light in order that the motor bicycle will not be interfered with and can remain of a size and build suitable for solo work. It must, moreover, be comfortable and easily detached, and most of these points could be obtained by springing the sidecar in every way, and



The ordinary sidecar chassis must be *nearly* rigid. To obtain strength, however, by absolute rigidity, means that weight is increased immensely without even achieving any safety limit over the enormous loads not due to reasonable weight, but to bouncing and rock shock. This shock *must* be met, and it should not be allowed to do away with the whole idea of the detachable sidecar.

constructing it in a somewhat novel manner, so that the road shocks may be absorbed in such a way that the necessity for *rigidity*, which has brought about the *weight* of the present attachment, is removed. A light vehicle can be sprung just as well as a heavy one if only it be remembered that there are other and better types of springs than quarter elliptic.

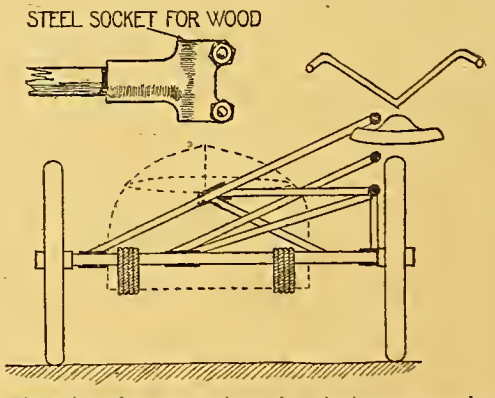
Points for Designers.

Now, in ordinary engineering design, such as in the construction of a bridge, a deflection will take place if the bridge is subjected to bumping, although it may be quite strong enough to stand the strain of a direct load, and the bumps would probably break it down. The same thing happens in the sidecar. The remedy for a detachable "bridge," which is light and handy, and can be used to cross any stream, like a sidecar on a motor bicycle, is to make it so that the deflection does not greatly increase the *loading* on the main parts. All mechanism and all cars spring enormously, and every part of a motor car chassis, including the frame, whips and bends in all directions. Designers should endeavour not to prevent this, but to make the units so that interflexibility does not matter, does not cause extra strain, nor prevent satisfactory working.

I have often thought that lessons from aeroplanes might be learnt by many designers, and I said as much nearly four years ago. On an aeroplane the chassis takes the weight of the machine, which is quite light, but it also has to withstand enormous shocks, both on landing and when the aeroplane is being taxied along the ground. Notwithstanding, breakages very seldom take place. Now the landing chassis of an aeroplane is just like a sidecar, being really an attachment, and I am proposing that cheap and light sidecars could be made on this principle. If this were done such an attachment when fixed to a motor bicycle would be very light and flexible, and quite rigid from the point of view of standing alone, but the whole chassis would have a slight amount of springy play. Also the combination as a whole would look smart, and anyone could have such an attachment fixed to his machine and attach it without the least difficulty.

The Advantages of Flexibility.

By saying that the machine should be interflexible, I do not mean to imply that the frame should be sprung as much as the wheel. It would be like a shock-absorber on a quarter-elliptic spring which gives way before the main spring. With a flexible chassis the body could be slung on rubber stretchers, and, even if only a couple of inches whip in the chassis were allowed for, enormous strength could be obtained, and, by having taken up the shock, the strength would be there by simply making the machine very little heavier than would be necessary to carry the direct load. The direct load is very little more than the weight of the passenger. If the modern light sidecar combination is used on rough roads, it is very uncomfortable and not always safe, and, moreover, often considerably strains the motor bicycle; but if the strains on the motor bicycle are localised on the vehicle for which it was designed, the sidecar stresses imposed on the machine when cornering could be absorbed on the chassis of the whole outfit, which will be immensely strong. Were the chassis made of wood, for example, it would be difficult to avoid getting even more strength than was necessary. Such a chassis could easily be arranged to clip on to the machine, with the result that we should have excellent springing and plenty of comfort—just as upon an aeroplane



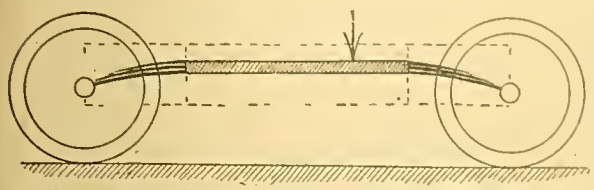
A sidecar for safety cannot have the wheel sprung much more than is allowed for a flexible chassis to take up *shock*, but cheap comfort for passengers is obtainable by a mixture of this "aero-springing" to the seat and flexibility of support. The unsprung weight is also reduced.

chassis—and, what is more, the outfit would not look in the least peculiar. It does not matter a bit if the wheel has not a parallel motion, as there is very little load on this wheel when running, and an up and down movement of three inches at a radius of three feet would be quite negligible. That it *is* negligible I have proved for myself, for I have tried a similar system on a fairly heavy light car, and also on an ordinary Bedelia cycle car, and, added to the comfort, cheapness, and safety, would be the excellent reliability, general satisfaction, and the wonderful value which the sidecar undoubtedly affords. Such a vehicle would not be over luxurious, but much more comfort-

The Mysterious Sidecar.—

able than most light sidecar outfits, and available to the thousands who do not want the cabriolet-omnibus type of attachment.

I have deliberately endeavoured to make out the reasons for this suggestion rather than enlarge upon



If to any type of chassis or "bridge" no springs are fitted, the girders, apart from heat expansion and so-called crystallisation, must be made many times thicker than necessary, for the shock or bouncing load may be six times greater than the direct weight.

the details themselves, because these can be suggested by individuals when once the basic facts are explained, and it is always more valuable and interesting to have to be original than to work out details of other peoples' ideas.

To make a rigid chassis as strong as one which is slightly flexible entails practically the doubling of its weight, and this entails expense, whereas a sidecar chassis should cost about 30s. each at the outside. It is not saying too much to state that the average sidecar, though sprung no better than a farm cart, is expected to travel at forty-five miles an hour. The springing of the sidecar wheel is not pleasant as a rule, and, in my opinion, unnecessary, while rigidity is dangerous, and it is bad for wear and bad for the pockets. While on this subject I would say that the Ford car owes most of its success to its general lack of rigidity.

All I have written so far is a matter of suggestion, and I can only hope that critics will be able to learn therefrom, and not criticise in a purely destructive manner.

STANDARDISATION.

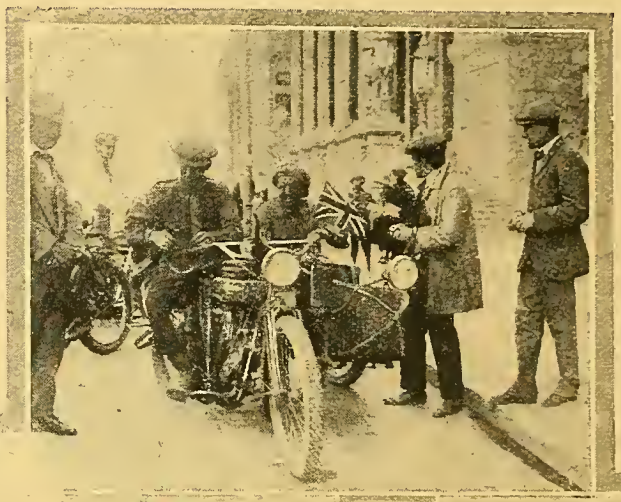
A CROP OF VEXATIOUS EXPERIENCES. By "Ixion."

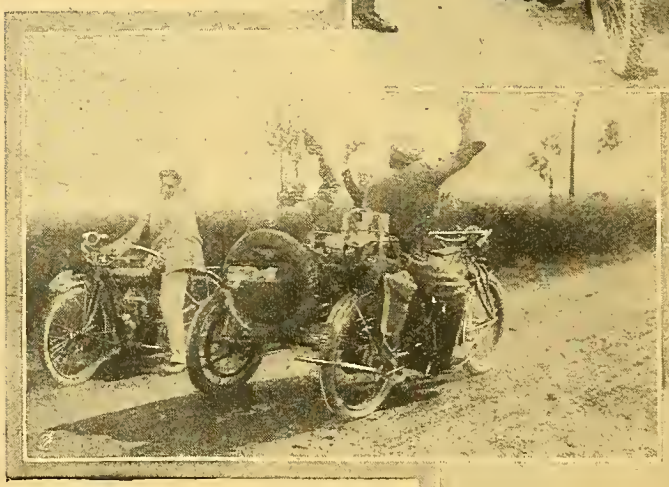
EVERY now and then I utter a mournful plaint on the utter lack of standardisation which marks the British motor trade, and this week I have had some lovely examples of the medley of sizes and measurements which is deemed inseparable from the industry. A *confrère* on *The Light Car* and myself set out in company, and ere long he struck a humoursome trouble which resulted in his being hauled home by a clothesline secured to the tail of a taxi; when he got his diseased 'bus safely in garage he presently found two nuts, each neatly housed in the recesses of a projecting tube, each of which had to be removed, and for neither of which an unusually full garage equipment could furnish a tube spanner. I love to see an engineer—and a conceited one at that—knocking nuts off with a hammer and chisel in public; it is excellent moral discipline for these swanky birds. The next night my colleague came in to admire the workmanlike fashion in which I proposed to fit out a new bicycle. The job looked simple. I had merely to fix two dry batteries on its tail, plus a hooter and lamp on its front. The back chain stays were so short, and so lumbered up with brakework, that the tail lamp wouldn't go on them, and after an impassioned argument I excited his derision by mounting it on one leg of the stand. Then we got to work on the head lamp battery, which was supposed to clip over the carrier bar, with a secondary clip on a carrier strut. The clips were the wrong size, thanks to the controversy which exists in the trade as to the best diameter for carrier tubing, and as to whether it should be round or D-shaped. I bent up some fresh clips. Then the strut clip proved to be fitted at quite the wrong angle, and some dishonest friend had eloped with my box of drills. Amidst shrieks of laughter I refitted the clip with the aid of a hammer, a large nail, and a rat-tail file. Then the handle-bar tube was found to be $\frac{15}{16}$ths, while the hooter clip, plus liners, was only adapted for 1in. or $\frac{7}{8}$in. bars; I accomplished miracles with sandpaper packing. The bicycle—like most modern machines—was innocent of a lamp bracket, and I set to work with an English bracket and an enemy-made lamp, which required much adapting to each other, not to speak of the cunning dispositions of the Bowden wires and front brake work, which almost prevented a tongue bracket from finding a lodgment of any kind on the handle-bar stem. We ended a quarrelsome and hilarious evening by speculating whether we shall ever get standardisation of such universal components as handle-bars, chainstay tubing, carrier tubing, lamp brackets, and the like, until some mammoth financier concentrates the entire industry into a single Trust.

Mr. Paula Rosa, jun., vice-president of the Rio de Janeiro Motor Club, and his Premier 3½ h.p. two-speed sidecar outfit.

Johannesburg to Cape Town by Sidecar.

SCENES ON THE SUCCESSFUL 1,000 MILES SIDECAR JOURNEY.





WHAT is claimed to be the first attempt to ride a motor cycle from Johannesburg to Cape Town was successfully accomplished last month by Messrs. Percy Hunt and Charles Morley, of Johannesburg, South Africa, on a 7 h.p. Indian sidecar outfit.

Johannesburg was left on Saturday, November 13th, at 3 p.m., and after an adventurous journey Cape Town was reached on the following Friday at 4.30 p.m. The distance is about 1,075 miles, and the net running time was 55¼ hours, which gives an average speed of nearly 19½ miles an hour—a remarkably high average when one thinks of the rivers to be forded and other difficulties to be overcome.

It is interesting to compare the foregoing figures with those relating to a run over the same course made in September last by a Napier car. In this case the start was from Salisbury, Rhodesia, which is nearly as far north of Johannesburg as the latter place is from Cape Town. The Napier, which was driven throughout the the trip by one man, Mr. A. C. Henderson, broke the journey at Johannesburg, and the route followed thence to Cape Town appears to be the same as that followed by Messrs. Hunt and Morley on the Indian sidecar. The latter made quicker progress than the Napier in both gross and actual running time. The actual running time of the car was 61 hours and of the sidecar 55¼ hours, but it is important to remember in comparing these figures that two men shared the driving of the sidecar, while one drove the car throughout, though the car driver had a companion.

One of the toughest propositions successfully tackled by Hunt and Morley was getting across the Modder River, which at the point and time of crossing was 100 yards wide. In investigating its depth Morley had a narrow escape from drowning, but finally men and machine got across, the former taking off the magneto and then pushing the outfit across.

Travelling through the night on one part of the trip they came across a party of Hottentots, who were so startled by the two headlights attached to the Indian outfit that they left their fire and dashed into the surrounding bush. A little later a mule team was met, and as the mules had apparently never seen a motor vehicle before, the consequences were rather disconcerting for the waggon driver.

Some trouble was caused on a portion of the trip by a warm following wind, which caused the engine to get very hot and great discomfort to the men themselves. However, these and other difficulties did not prevent a splendid run being made.

(1) The end of the run. Messrs. Hunt and Morley at Cape Town.

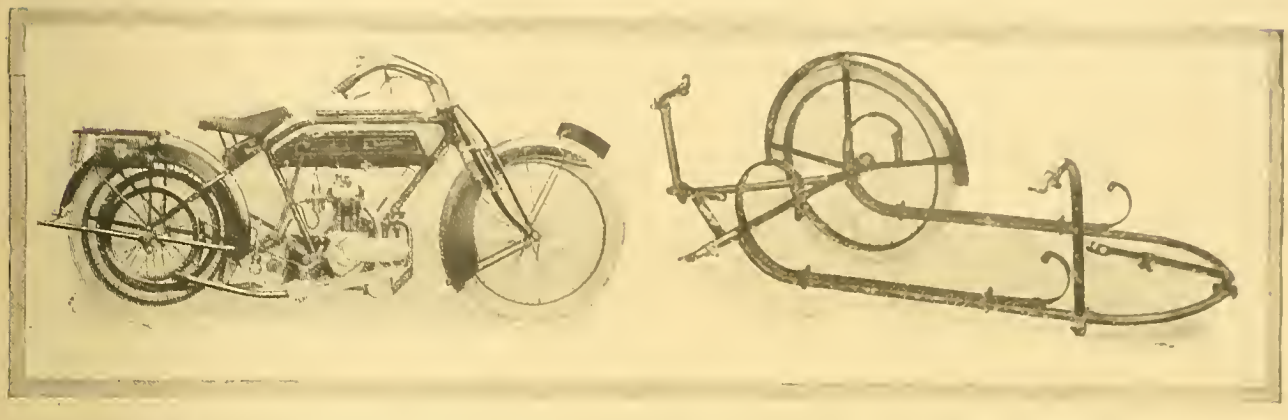
(2) Other motor cyclists raise a passing cheer as the Indian outfit rushes by.

(3) After a night's sleep on the Veldt—getting ready again for the "road."

(4) The "road" between Hopetown and Strydenburg, where the Indian skidded in the sand towards the bush. Hunt has a reviver whilst his companion uses the camera.

Alterations to the Latest Blackburne.

Single-cylinder Engine, 499 c.c., with outside Flywheel; Three-speed Countershaft Gear; Chain and Belt Drive.



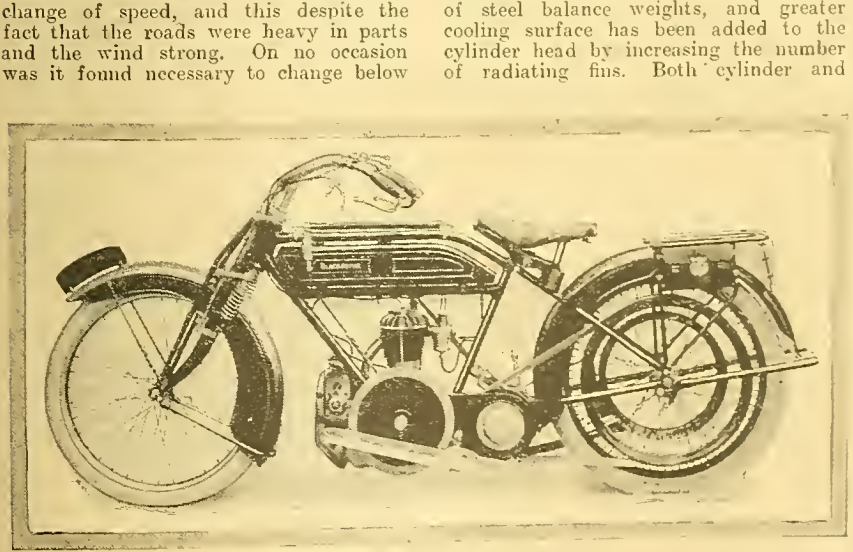
(Left) The 3½ h.p. 1916 model Blackburne. Note the method of operating the clutch from handle bar and neat trouser guard
(Right) The Blackburne sidecar chassis, showing at the rear the new triangulated strengthening stay.

THE Blackburne 3½ h.p. motor bicycle has a reputation for sound design and excellent wearing qualities which is not surprising when it is taken into consideration that it owes its origin to the brains of young and keen riders whose road experience was considerable before its design was finally settled. Though we had ridden the machine solo on previous occasions we had had practically no experience of it as a sidecar mount, so we took the opportunity of travelling to the works at Tongham, near Aldershot, in one of the latest models, which was driven by Mr. G. Q. Roberts. The journey down was accomplished most comfortably, and the single-cylinder engine pulled remarkably well, its heavy ontside flywheel allowing it to "hang on" to top on the hills, and to climb most of the rises *en route* without a change of speed, and this despite the fact that the roads were heavy in parts and the wind strong. On no occasion was it found necessary to change below second, and on this speed the machine was quite fast. On the summit of the Hog's Back we took control, and were soon bowling along that wonderful road at quite a comfortable pace. We found both the Sturmey-Archer gear and the handle-bar actuated clutch smooth in action and easy to operate. The engine is well balanced, and the steering of the combination is all that can be desired. At the end of the run we were gratified to note that the whole machine was exceedingly clean, the frame being free from mud, and the crank case devoid of any traces of oil, a most desirable feature.

Latest Modifications.

There have been no very drastic alterations in the new model Blackburne. As regards the engine, the balance of this has been improved by the adoption of steel balance weights, and greater cooling surface has been added to the cylinder head by increasing the number of radiating fins. Both cylinder and cylinder head are beautifully cast, the fins being thin and well finished, while as to the head, the fins immediately adjacent to the valve ports are ¼in. higher than the others, thus allowing the heat in the hottest portion to be dissipated quickly. The valve ports have been considerably deepened to allow the gases a free passage. This has necessitated lengthening the connecting rod to a certain extent in order that the compression may remain unaltered. A new piston has been introduced which has the two rings at the top instead of one at the top and the other at the bottom as formerly. This has been found to be better from the lubrication point of view, as, though the bottom ring in the lowest portion of the piston is claimed to steady it in the cylinder. Mr. J. S. Holroyd, the works manager, considers that this is a fallacy, as the piston can still rock in the ring. In the latest piston there is a groove in the lower extremity to collect oil, and the bottom edge is rounded off.

Other improvements consist in the fitting of new footboards with heel plates at the back, a Splitdorf magneto (which is well protected from the elements), and the latest pattern Amac carburetter. Not the least important is the provision of a suitable guard for protecting the driving chain.



Transmission side of the latest Blackburne, showing outside flywheel, a distinctive feature of all Blackburne models since No. 1 was manufactured.

Sidecar Alterations.

Messrs. Burney and Blackburne manufacture a special sidecar for their motor bicycle. The frame is of the dropped pattern the principal portion of which consists of a single U-shaped tube, the rear extremities of which curve upwards to the axle, which has now been strengthened by means of a triangular stay capable of being used as a luggage platform or a spare petrol tin carrier. The support running from the seat-pillar of the motor bicycle is attached to the apex of the triangle. The sidecar is attached to the machine at four points. On the road we found the sidecar to be most comfortable and well sprung.

Fallen Trees.

The gale on Monday brought down many trees, with the usual consequence of blocked roads. Two horses had a narrow escape in the neighbourhood of Birmingham, but up to the present we have heard of no motor cycling accidents from this cause. Apart from this, the gale benefited the roads considerably.

Well-known Colonial Rider joins the R.F.C.

Mr. A. G. Salmon, the South African rider and record holder on a Norton motor cycle, has arrived in England for the purpose of taking a commission in the R.F.C. His knowledge of the internal combustion engine and wireless telegraphy should stand him in good stead in this famous corps.

Troubles Never Come Singly!

A member of the staff who was due at our Coventry office at 10 a.m. on Tuesday commenced a trip from town by road at six o'clock. Progress, however, was twice delayed by fallen trees, which entailed a detour in one case, but trouble was not over, for a couple of punctures (one in the dark) and a choked carburetter livened the proceedings on this very cold and windy ride, which took two hours longer in consequence.

The Fleet and Motor Cycles.

At the present time a series of lantern slides prepared by *The Motor Cycle*, depicting motor cycling events held during the last two or three years, and certain motor cycle sections of the Army, are on the high seas being exhibited to our brave lads in the Navy. The slides are in the care of the Chaplain of H.M.S. *Antrim*, who has kindly undertaken to pass them on to other ships in company with the *Antrim*. We should be very happy to lend the set of slides to other naval officers for the benefit of the men on board on receipt of an application to that effect.

Motor Cycles in Macedonia.

The paragraph in another part of this issue referring to the absence of motor cycles in Macedonia evidently refers to one section only, for we have a letter from a lieutenant in the R.E., who says that "the go-anywhere motor cycle is doing its duty bravely amongst the rocky hills and muddy valleys of Greece and Serbia."

Development of Military Motor Cyclists in U.S.A.

The war has caused the United States Government to overhaul and enlarge its naval and military resources, and the mechanical side of the subject is receiving a good deal of attention. The employment of motor cyclists for various duties such as are covered by British riders has been decided upon. One instance in which they will be employed is as scouts to large armoured cars, and we learn that a motor cycle squad will be included in the armoured motor car train with which the New York National Guard is to be equipped during the coming year

The Repair of War Crocks.

Like most other firms, Messrs. Burney and Blackburne are engaged in war work. Now, in these days, it is obviously unwise to say much in this direction, but there can be no harm in mentioning that a portion of this consists in repairing war-worn motor cycles—warriors battered and smashed, and often bullet torn—which arrive from the Front. We saw several makes of machines, and most of these had been soundly repaired, and were resplendent in fresh coats of enamel in the official W.D. colour. But the "wrecks" before treatment were pitiable to behold.

SIDECARS AND ACCESSORIES.

In "The Motor Cycle" of January 27th a feature will be made of the latest sidecar attachments and motor cycle accessories.

SPECIAL FEATURES

TWIN-CYLINDER TWO-STROKES.

OVERSEAS TRIALS.

THE MYSTERIOUS SIDECAR.
By Dr. Low.

Irish Christmas Trial.

We are able to publish in this issue an account of a Bank Holiday motor cycle trial held in Ireland. It was apparently the only competitive event this Christmastide.

Despatch Rider Recruits.

We learn on excellent authority that the War Office will shortly issue revised instructions respecting the recruiting of motor cyclist despatch riders in the R.E. The instructions are expected to bear upon the new conditions brought about by Lord Derby's scheme.

Motor Cycles and Head Lights.

According to the new lighting regulations (reviewed in our last issue), in certain areas head lights are prohibited. This, one might reasonably suppose, would mean that no motor bicycles can be used after dark in the streets, since these vehicles use head lights only, and have no side lamps. We were, however, informed definitely by an official at the Home Office the other day that this was not the case, and that all the authorities concern themselves with is the size and power of the lamp.

Boat-shaped Sidecars.

M. Vallée-Picaud, who may be remembered by some of our readers as the driver of a Clyno in the different Continental trials, such as the Paris-Nice, in writing to us says that he has been very interested in the different shaped sidecar bodies, especially those resembling boats, and reminds us that his firm manufactured a boat-shaped sidecar body as far back as 1913, which was known as "The Skiff." It was taken through a number of French trials, such as the Paris-Nice and Marcelle-Lyon pas les Alps. M. Vallée-Picaud says he thinks it can claim to be the first "boat" to be taken to the top of the Alps.

Note the Date!

Sidecar attachments and accessories for motor cycles will form the chief contents of a special issue of *The Motor Cycle* to be published on Thursday, January 27th.

Result of a Collision.

Returning to Bisley from home on his motor cycle, Sergeant F. H. Brown, M.M.G.S. (late of the Rex Co.), ran into a car coming out of a side road and broke his right arm. He is at present in hospital at Oxford, and doing well.

Christmas Riding Conditions.

Those who used their motor cycles this Christmas to journey home or to friends experienced very bad weather. On Christmas Day it rained almost continuously, Sunday was a little better with showers only, but on Boxing Day there was a heavy gale, which rendered motor cycling most uncomfortable, but not impossible, for we met many riders —a large proportion khaki-clad.

Average Prices.

We give below the average prices of second-hand models offered for sale in *The Motor Cycle*. Where it is possible to obtain a sufficient number of each model the average for the past week is quoted. If there were not at least two advertisements, then the last occasion on which they were quoted is given.

Greetings from the Front.

We have to thank many of our readers for the Christmas cards and New Year greetings which have come to hand during the past few days. Many are from well-known riders at the Front, and actually include messages from Macedonia, Gallipoli, and Italy.

Breaches of the Lighting Regulations.

An Army Lieutenant who signs himself "BB 2148" writes: "I should like, through the medium of your excellent paper, to warn motor cyclists who reside near Tyneside against driving at all fast on foggy nights. The other night, on a journey of only four miles, I encountered a cyclist with a red head light, and a mile further on a cart with a white rear light. If vehicles are found on the roads in this condition, I consider they should be fined much more heavily than those who merely exceed the speed limit. If I had been driving fast at the time, I should have had a bad accident in either case."

The Motor Cycle Club of South Australia.

On November 6th a flying start half mile speed test was held on the Fullarton Meadows road, with the times as follows:

CLASS 1.—UP TO [illegible] C.C.

		Time
1	L. Warren ([illegible] Elliott Special)	40
2	J. V. [illegible] ([illegible] Lewis)	58

CLASS 2.—[illegible] TO [illegible] C.C.

1	J. H. Gilbert ([illegible] I.A.P.)	41
2	G. Fraser ([illegible] Lea)	47
3	C. S. Lindsay ([illegible] Douglas)	60

CLASS 3. STANDARD AND PRIVATE OWNED MACHINES UP TO 600 C.C.

1	L. Warren (3½ Elliott Special)	*44s.
2	T. B. Ragless (3½ Kent Roadster)	53s.
3.	L. E. Kotzur (3½ Kent)	54s.

CLASS 4. T.T. STRIPPED MACHINES UP TO 500 C.C.

1.	W. A. Driver (3½ Lewis)	29s.
2.	E. E. Kotzur (3½ Kent Special)	29s.
3.	H. A. Behren (3½ Peerless)	34½s.

CLASS 5. OVER 600 C.C.

*1.	E. C. Wagner (8 Blue Spec-Jap)	27s.
2.	N. K. Torode (7 Indian)	27½s.
3.	C. E. Nalty (7 Indian)	28½s.

*Fastest time of the day.

CLASS 6.—PASSENGER MACHINES UP TO 600 C.C.

W. Courtney (3½ Lewis C.) .. 52⅘s.

RIDING A MOTOR CYCLE IN A COMMUNICATION TRENCH.

A British despatch rider in the Dardanelles carrying a message up to the Brigade headquarters after getting into the communication trench.

MOTOR CYCLING IN NORTHERN INDIA.

The Account of a Trip into Kashmir.

I HAVE frequently read most interesting accounts in *The Motor Cycle* of trips on motor cycles through the British Isles and elsewhere, and think that readers would be interested to hear about one recently performed in Northern India.

The particular route followed was from Peshawar to Srinagar. There are two roads from railhead to Srinagar, one *via* Murree, and one *via* Abbottabad. We chose the latter, as coming from Peshawar it was the nearer. Our outfit was a 3½ h.p. three-speed 1913 Triumph with basket sidecar, and we took it by train as far as the railway goes. This is Havelion, a wayside station, which we reached at 7 o'clock one May morning, and having made a hearty breakfast in the train, we proceeded to load up at once. It was really wonderful what we contrived to stow away on that small vehicle: two passengers, a roll of bedding, tiffin basket, small suit case, a spare tyre, and that most necessary box of tools and spares, as well as two tins of petrol, a third being emptied into the tank prior to departure. It is impossible to procure petrol *en route*, and as the distance from Havelion to Srinagar is 167 miles, it is most necessary to take a sufficient supply.

We made a good start, the engine pulling well up some very steep hills. We passed Abbottabad, a pretty little station and the headquarters of several Gurkha regiments, but some way beyond this misfortune befell us. The road here was truly shocking; sharp stones and slabs of fallen rock were lying about in all directions, and there were wheel ruts six to ten inches deep. The unfortunate occupant of the sidecar got severely bumped, until finally came a loud report, and we discovered one of the sharp stones had mercilessly cut through the sidecar tyre.

(Top) Nearing Rampur, showing one of the many hairpin bends which have to be taken very slowly.

(Left) Road mending in Kashmir. A steam roller is just discernible in the background.

(Right) A stop for lunch. Note the luggage strapped on the carrier of the Triumph.

Motor Cycling in Northern India.—

All along the Kashmir road are small dak bungalows at intervals of about twenty miles or so, and at any of these one is always sure of a good meal and comfortable quarters for the night, and there is no need to announce one's arrival beforehand. Our first night we spent at Gurhi Hari-bullah, a small bungalow, situated high up above a rushing torrent of a river. Next day we found the road in better condition, and covered a distance of seventy-four miles. After heavy rain the road is frequently impassable, the bridges being washed away, and often great boulders come hurtling down from the high cliffs above. But we were lucky in our weather, and encountered no obstructions or landslips. Thirteen miles on we reached Domel, 2,100 feet, and here a toll of five rupees is due for motor cars, and two rupees for humbler vehicles.

Climbing to Snow-clad Mountains.

At this point the Abbottabad route we had come by joins the Murree road, and for the rest of the way there is only one narrow road. From now onward the gradient is very continuous, and pedalling was necessary to help the engine. The latter was working splendidly, for the load was indeed heavy—42 stone, including luggage, passengers, and bicycle. Towards evening the scenery got more mountainous, and we caught glimpses of snow-clad peaks in the distance.

We reached Rampur (4,300 feet) that night and found a charming new bungalow to put up at and an excellent dinner. It was very cold here, for we had been steadily climbing all day.

Next morning we left at seven o'clock, and expected to reach Srinagar about ten, but as far as achievement went we did not do it by a long way. The scenery on the next part of our journey was by far the prettiest we had come across yet. The river rushes along at a tremendous rate, over huge boulders, and the trees and foliage are beautiful, while away in the distance are the great snow mountains.

From Baramulla up to Srinagar the road is flat and ugly, and what view one might obtain of the mountains is shut out by rows of tall poplars, planted so close together that a fat man could not squeeze through in places. However, we were grateful enough for the shade they gave.

Hereabouts the hub gear came out of adjustment, and to remedy matters I proceeded to tighten up the adjustable gear rod nut, when, to my dismay, the rod snapped off. There seemed nothing to be done but traverse the remaining twenty miles on lowest gear. This was truly heart-breaking, as from here on to Srinagar the road is absolutely flat and straight and in excellent condition, and we had been looking forward to a really fast spin all the way. Thus we plodded along at ten miles an hour for some distance, and then decided to make one more effort to mend the rod. We tied the pieces up with string, and on operating the change lever, to our intense delight the gear suddenly slipped into second, and so the remaining distance into Srinagar was not so slow after all.

High Price of Petrol.

It is advisable for motorists to send on a supply of petrol to Srinagar, for prices there run very high, as much as 13s. 4d. being asked for a four-gallon drum.

There is an excellent engineering firm in Srinagar, and next day we took the bicycle there to have the gear rod repaired, which was accomplished most satisfactorily. After a thorough cleaning of the engine, the good old Triumph was all ready for the return journey, which, alas! was due to take place in a fortnight's time, leave in India being of very short duration this year owing to the war and consequent shortage of officers.

C.A.T.

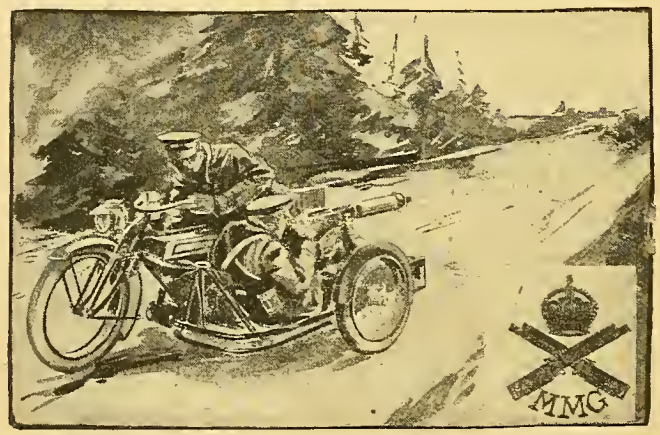
CHEPSTOW CASTLE, MONMOUTHSHIRE

In the foreground are two Matchless sidecar outfits

Bank Holiday Trial in County Wicklow.

THE Dublin and District Motor Cycle Club held a reliability trial on the Bank Holiday. The event was more or less of a holiday character, and the distance was under seventy miles, so as to avoid riding in darkness. The route lay for the most part in Co. Wicklow, and the crucial part of the trial was the crossing of the Wicklow mountains by Wicklow Gap. The ascent of the mountains from the eastern side was one of the two non-stop sections of the route, the other being the ascent of the Sugarloaf mountains from Kilmacanogue to Calary. Under ordinary conditions neither of these ascents would be regarded as serious tests for a motor cycle, but with the roads in a more than usually heavy state they proved very trying on Monday, and quite a number of penalties were registered against the competitors on both hills.

The start took place at ten o'clock from Donnybrook Bridge, the twelve competitors being despatched at one minute intervals. The outward journey was by Bray and Kilmacanogue, where the first open check was taken before entering on the non-stop section to the top of the Sugarloaf. It was no easy matter to maintain the scheduled speed of twenty miles an hour to Mountain Stage Tavern, and the extra allowance given to the low-powered passenger machines and the lightweights was needed by most of the riders of these machines. Afterwards it was easy going by Calary, Roundwood, Annamoe, and Laragh to Glendalough, where two hours were allowed for luncheon.



The drawing on the regimental Christmas card of the Motor Machine Gun Service. The Editor acknowledges with thanks receipt of several from different recruits.

Climbing the Mountains.

Immediately after the restart the crucial portion of the trial was entered upon. A sharp hairpin corner had to be tackled at the point where the main road was left, but all the competitors took it with caution, and there were no failures on the turn. As on the Sugarloaf, there was difficulty in keeping up to scheduled time, and although there were no stoppages on the hill, the variations from time at the Granabeg check should find a winner without the aid of a secret check that was taken on the last stage of the journey. The homeward route was by Hollywood, Poulaphuca, Brittas, and Tallaght to Terenure, where the following were checked in:

W. Fennell (4 h.p. Norton and sc.)
P. H. Hurse (4½ h.p. B.S.A.)
C. B. Franklin (7 h.p. Indian and sc.)
J. Clarke (5-6 h.p. Rudge).
T. W. Ladd (6 h.p. Bradbury and sc.)
S. Allen (3½ h.p. James).
J. Carter (7 h.p. American Excelsior).
J. Redmond (7 h.p. Indian).

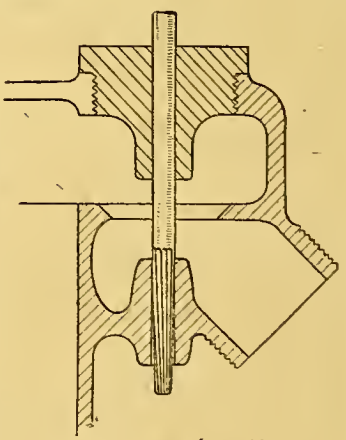
The other competitors were—G. Mayne (10 h.p. Calthorpe), who stopped at Glendalough; G. A. M. Curtis (7 h.p. Indian and sidecar), who stopped at Kilmacanogue; J. Cunningham (2¾ h.p. Douglas), who retired in Rocky Valley with magneto trouble; and R. Walsh (4¼ h.p. B.S.A.), who stopped at Mountain Stage Tavern.

MOTOR CYCLE TYRE REPAIRS.

WITHOUT wishing to detract in any way from the excellence of Mustikon patches, I may perhaps be allowed a small criticism of my colleague "Road Rider's" article on the subject of tyre repair. Taking his sketches in order: horizontal expansion must occur with Mustikon patches as with the ordinary variety, but this expansion should not be detrimental in any case, as the tube and patch expand together, and if the tube be a good fit the expansion will be but slight. Vertical or lifting strain will only occur with a properly fitting tube if it be inflated before being put into the cover; when in the cover the air pressure will force the tube and patch into close contact and assist adhesion. Mustikon patches are difficult to place in position, and do not readily adhere to the inside of a tube, though they stick well on the outside. Another point, too, occurs to me. How can a Mustikon patch be applied when the tyre is punctured through a similar patch already in position? Prepared patches are often very hard to remove, and the shank of a Mustikon is not long enough to reach through tube and patch.

AN AMERICAN TIP.

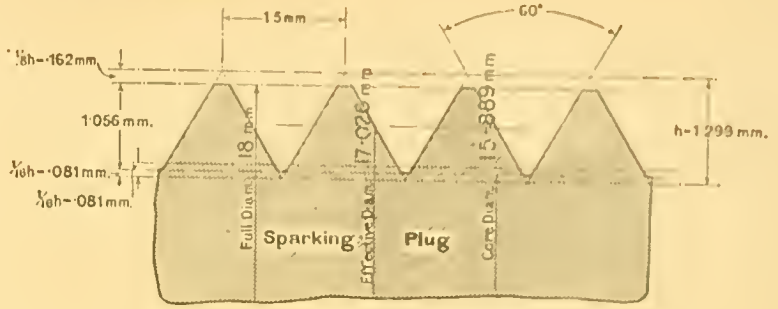
IN reamering out a valve guide, it is very essential to hold the reamer perfectly central and upright. This can be done by making a reamer guide such as is shown in the illustration herewith, which can be constructed of metal or hard wood. The threads, which should fit the inlet valve port or valve cap thread, in the case of side by side valves, should be turned on the lathe and the hole bored before the block is removed from the chuck; thus they can be cut perfectly true and will then hold the reamer correctly in position.



Reamering a valve guide.

THE STANDARDISATION OF SPARKING PLUGS.

STANDARDISATION of motor parts is always desirable, and, though sparking plug threads (with the exception of the American taper thread) have always been more or less uniform, we welcome the "interim report" by the Engineering Standards Committee giving all the dimensions which have been agreed upon and authorised by that body. The angle of the thread is 60°, and the pitch of the threads 1.5 mm. The effective diameter of a screw having a single thread is the length of a line drawn through the axis and at right angles to it, measured between the points where the line cuts the slopes of the thread. The other measurements will be readily understood on reference to the accompanying illustration.



The standard sparking plug thread adopted by the E.S.C.

OVERSEAS EVENTS

East London (S.A.) Club's Activities.

THE East London (S.A.) M.C.C. held a petrol consumption test on November 14th. The route was from East London to Mooiplaats and back, a distance of fifty-six miles, and the set speed was 18 m.p.h. There were thirty entries, and the results were as follow :

		oz.
1.	H. Feller (3½ Rover)	74
2.	W. Innes (3½ Triumph)	80
3.	E. C. Martin (3½ Triumph) ..	81½
4.	V. Snell (4 Triumph) . ..	82½
5.	F. Miles (3½ Triumph)	87

The winner's average was 121 m.p.g. The outward journey is mostly up hill, but on the return journey there was a very strong head wind, so strong that not one of the competitors could free engine down any of the hills, some of which were very stiff. The road is the best in the district, but is, nevertheless, none too good, there being some nasty patches of loose stones, stiff climbs, and sharp bends.

Racing on the New Brighton (N.Z.) Beach.

The Pioneer Motor and Sports Club, of Christchurch, held three races on the New Brighton Beach on October 30th. The beach was wet, and the riding consequently heavy. The singles will be seen to have performed well. Results :

FIVE-MILE MAIDEN HANDICAP.—F. N. Mantell (3½ Triumph), handicap 1m. 30s.; A. Moreland (4 Triumph), 1m. 15s.; E. Smith (9 Dayton), scratch. No times of this event were taken.

TWENTY-MILE SOLO HANDICAP.—F. V. Thomas (4½ B.S.A.), handicap 4m. 15s.; F. Haworth (4 Triumph), 4m. 15s.; W. Hollobon (4 Triumph), 4m. 45s. Winner's time, 20m. 38s. The winner made the fastest time.

TEN-MILE SIDECAR HANDICAP.—F. V. Thomas (4½ B.S.A.), handicap 2m. 10s., time 14m. 20s.; F. Haworth (4 Triumph), 2m. 10s., time 14m. 27½s.; G. B. Brown (4 Triumph), 1m. 45s., time 14m. 41⅗s. Brown made the fastest time.

Consumption Test in South Australia.

Competitions have again started in South Australia, but, on account of the drain of sporting members to the enlisting camps, competition is not so keen as in former years. On October 23rd a petrol consumption test was held over a distance of ten miles, with the following result :

		Ton-miles per gal.
*1.	F. Boyton (3½ Indian)	35.3
2.	W. Courtney (3½ Lewis sc.)	28.1
3.	E. Ferguson (4 Indian)	21.5

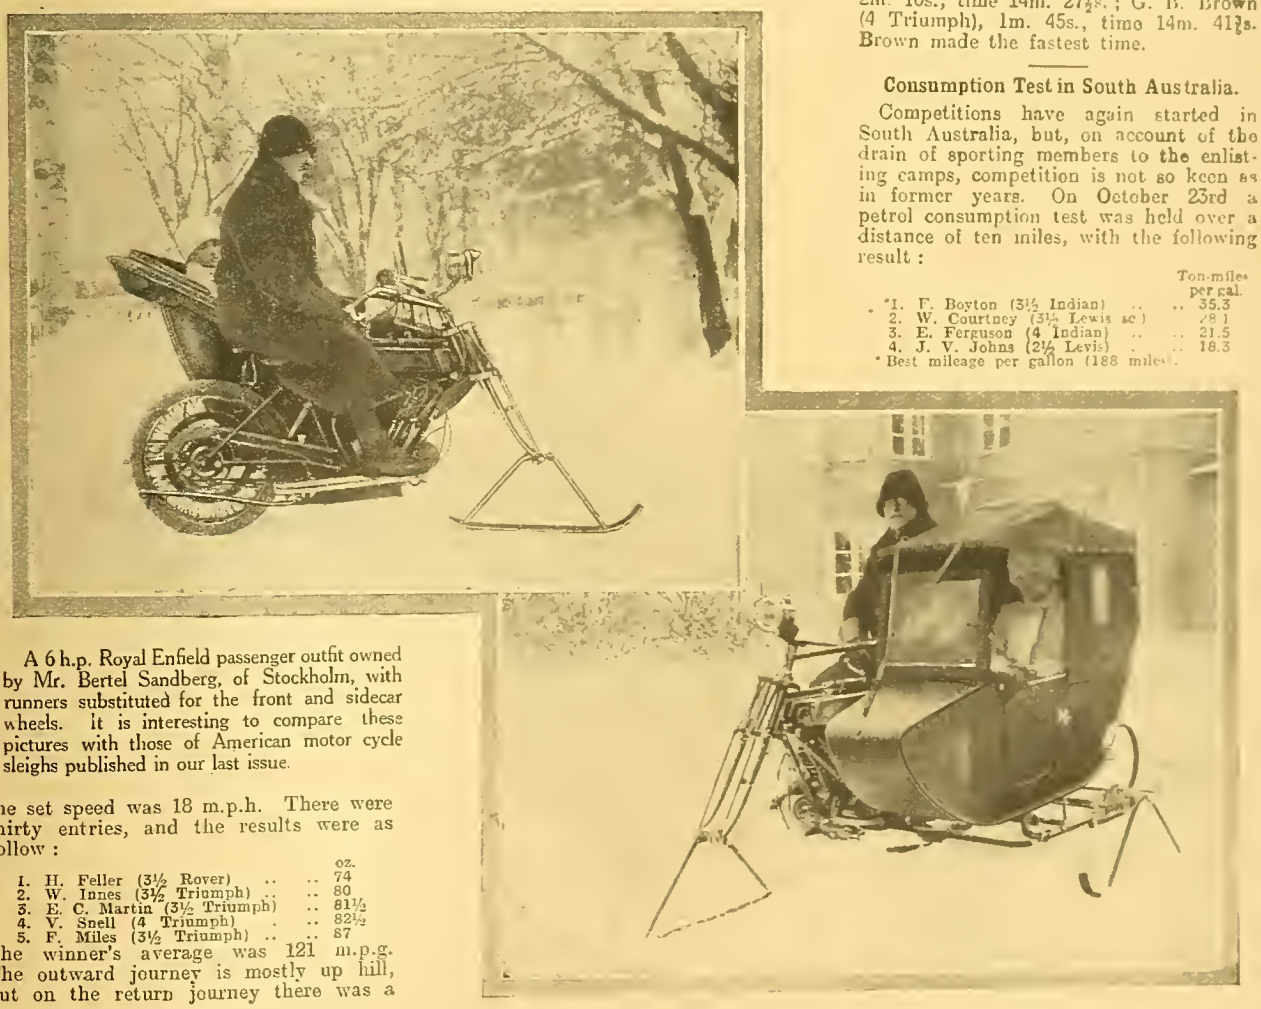
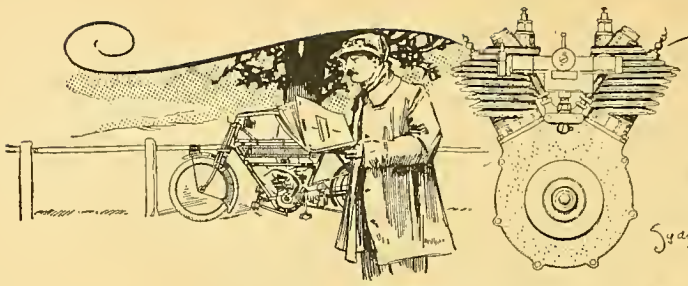
* Best mileage per gallon (188 miles).

A SIDECAR OUTFIT ON RUNNERS.



A 6 h.p. Royal Enfield passenger outfit owned by Mr. Bertel Sandberg, of Stockholm, with runners substituted for the front and sidecar wheels. It is interesting to compare these pictures with those of American motor cycle sleighs published in our last issue.



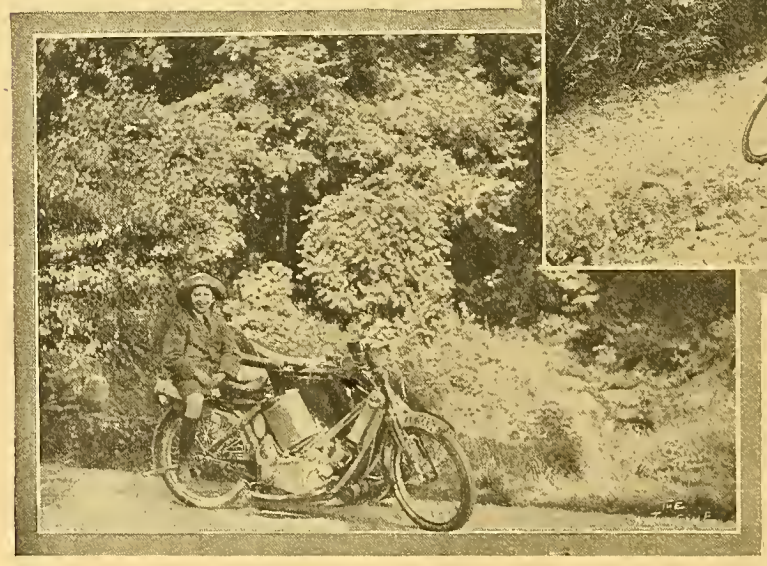
On the Road with a 3¾ h.p. Scott Sidecar Outfit.

THE IMPRESSIONS OF A COUNTRY RIDER.

I HAVE always possessed a distinct leaning towards the light sidecar outfit—*i.e.*, a 3½ h.p. single-cylinder machine with light sidecar attachment. This type of mount is far more sporting to ride in a mountainous district than the heavy twin outfit, which, with its low emergency gear, will literally climb a tree if judiciously handled.

It is just the possibility of "konking" out on a severe gradient, together with the necessity for careful handling, which adds so much to the sporting attractions of a ride over the ranges on a medium-powered outfit. I have long looked for one which, though sporting to handle on pleasure rambles through the hills, was capable of a high road speed on long main road journeys, the 3½ h.p. single falling somewhat short in this respect. Recently I have been riding a 3¾ h.p. Scott combination—by no means a new one, but one which has enjoyed decent usage, and this somewhat unconventional mount fills the bill exactly.

This year I have ridden several makes of passenger machines, and each has possessed its own little characteristics. Some were fast on hills, but comparatively slow on the level; others progressed uphill and down at the same monotonous purr, but none of them have proved so full of fireworks and the unexpected as the two-cylinder two-stroke I am now riding. The Scott sidecar, heavy though it be, makes practically no difference to the speed of the machine on the level. Given a good road it is quite as fast as an American 7-9 h.p. twin which I have been riding, but though fascinating to ride and sporting to handle it must not be imagined that the Scott can hold its own on hills with a big four-stroke twin. Considering its power this cannot be expected; it is slightly faster on hills than a good 3½ h.p. two-speed combination, but not so fast as a three-speed. On an open road it would leave either of the latter far behind, for the simple reason that one can let the engine "rev" downhill and on the level, without danger of overheating and without valve clatter. But over and above this the engine is capable of turning over at a terrific speed, and one acquires the habit of maintaining a higher road speed on a two-stroke water-cooled Scott than on any other machine of similar power I have handled.



A road test of a 3¾ h.p. Scott passenger machine. (Upper) Ascending a 1 in 5 gradient on a mountain path. (Lower) A halt in the woods.

The ability to permit the engine to "rev" without suffering discomfort, and without discolouring plated parts composing the power unit, is one of the great charms of riding a Scott. The machine is as comfortable at 48 m.p.h. on the dead level as it is at 30—in fact, more so, since the soft purr of the exhaust at high speeds is rather soothing. The absence of valves and the continuous clatter which these members create at high speeds is pleasant to experience. Very few four-stroke machines of correspond-

On the Road with a 3½ h.p. Scott Sidecar Outfit.—

ing power that I have ridden have proved comfortable at a speed exceeding 35 m.p.h. over long distances, but on the Scott it is merely a matter of seconds to attain this speed from a standing start, and vibration does not become excessive till a speed far above the requirements of safe touring is attained. One simply permits the engine to purr over at half throttle, adjusting the speed on corners by the half-compression release, and since the engine will "rev" indefinitely there is no need to cut out on ordinary down grades.

One is apt to form the impression that the Scott engine turns over very fast at normal road speeds, but as a matter of fact it is geared much higher than most four-strokes, the standard gears being 4⅛ and 7.6 to 1 for solo work, and 4.3 and 8 to 1 for sidecar.

Handling and Control.

Given a natural gift for handling motor cycles, the Scott is one of the most delightful machines to handle, though it is quite conceivable that the indifferent rider would find it rather difficult at first, and blame the system of control. The foot-controlled gear enables one to change from one gear to the other in an infinitesimal space of time, and it cannot be doubted that this feature has had much to do with the success of the machine in various speed tests. Having no weight of flywheel the engine picks up instantly in changing down, and for the same reason the high gear goes straight home, there being no konk or labouring with the even torque.

Skill in handling a Scott, however, is largely dependent on the rider's ability to use the right foot and the left hand in exact unison. One does not depend so much upon the carburetter controls as in the case of most four-strokes. The engine speed is governed largely by the half-compression, and, in traffic, much depends on the smartness in planting home the gear and releasing the half-compression lever at just the right moment.

To obtain the best results a Scott requires handling, and there are few machines which lend themselves so well to the expert rider. Once having acquired the art, one can slip through traffic and take certain liberties that one would probably not attempt with all machines, the quick acceleration and instantaneous action of the gears enabling one to slip in and out without risk. True that we do not all desire to perform circus tricks on the King's Highway, but we have most of us a sneaking pride in the manner in which we handle our machines through the crowded thoroughfares.

Maintenance.

As regards petrol consumption, this is not to be complained of considering the many advantages of an even torque. On a practical test with passenger, luggage and full equipment aboard, the machine I am riding does 54 m.p.g. over mountainous roads, including one or two freak gradients. The engine consumes about the same quantity of oil as a 5-7 h.p. twin. The wear on rear tyre is about the same as on a 3½ h.p. single. One might anticipate something better, but the foot-controlled gear is not conducive to the longevity of the rear tyre. All things considered, the question of maintenance is not one that need influence one's decision, for there are many medium-powered sidecar outfits more expensive to run than the Scott.

The Scott Sidecar.

The maker's sidecar is unquestionably designed on excellent lines, and those interested in sidecar design might do well to study its construction. The springing of the body is ingenious and effective, and the chassis design is splendidly thought out. I am rather inclined to think that the body is too well suspended, for, on pot-holey and tortuous roads, I note my passenger swinging in all directions and omitting grunts, while I, mounted comfortably on an Al'All saddle, remain comparatively stationary.

In justice to the makers, in whom I have no material interest, I cannot refrain from saying that there are very few machines which I have found so interesting and fascinating to handle as the machine under review.

A MOTOR CYCLE CLUB OUTING IN BRAZIL.

Meet of the Rio Moto Club, the recent formation of which was announced in *The Motor Cycle*, in a forest on Tijuca Hill.

MILITARY NOTES.

Cheery New Year Messages from Motor Cyclists on Active Service.

LATEST DESPATCHES FROM THE FRONT.

SINCE our last issue went to press a few more messages were received from men at the Front, and so were, unfortunately, too late for inclusion in the "Christmas Despatches from Service Readers" published last week. There are two joint letters, each from two well-known men. The first is from Graeme Fenton and Philip Grout, whose message reads as follows:

"Graeme Fenton, Capt. A.S.C., and Philip Grout, Lieut. R.E., convey to all the old brigade at home their very best wishes for the New Year. May 1916 prove a record one in a way beneficial to all at home and elsewhere. To ensure 1916 being 'beneficial,' enter at once for the 'great trial'; entries close December 31st, 1915."

Sergts. J. Cocker and J. H. Pountney, both of the No. 5 Battery, M.M.G.S., on active service, write:

"You will be pleased to know that the No. 5 Battery is still going strong and doing some excellent work. As for the past nine months we have been living within two or three miles of the firing line, where cameras are unknown, a service snapshot is out of the question. Wishing you and all old friends a prosperous New Year."

It seems ages since we have heard of Lieut. F. A. McNab, of the R.N.V.R., who has been on patrol service off the north coast of Scotland. We have now had a New Year greeting from him from the South of England, which reads:

"The very best of luck in 1916 to all my old friends, and I hope and trust before it ends that we may all be back at dear old Brooklands again. What a day the first meeting at Brooklands will be after peace is declared! Wishing the good old *Motor Cycle* a still better New Year."

Flight.-Lieut. Victor Wilbertorce, who joined the R.N.A.S. before the outbreak of war. Previously he was a well-known competition rider of Douglas bicycles and G.W.K. cycle cars.

Despatch riders who were attached to the 1/1st Royal Wilts Yeomanry for fifteen months until that regiment left England for active service. Reading from left to right: Lance-Corporals Corders, Rose, Bolt, Corporal Palmer, Lance-Corporal Hopkins, Ambulance-Driver Sudweeks, Lance-Corporals Munday and Lockhead.

A lady motor cyclist has received from a member of the M.M.G.S. on active service a brooch made of a piece of a German shell.

"The motor cyclists of the 1st Canadian Motor Machine Gun Brigade wish all their comrades and fellow motor cyclists a prosperous New Year." —From Pte. J. Aldersley, 1st Canadian M.M.G. Brigade.

Sidney George, the Indian rider, has, we learn, joined the R.F.C. as a despatch rider.

ANOTHER DESPATCH RIDER KILLED.

CORPORAL JACOB GARSON, a despatch rider in France, and formerly an active member of the Newcastle and District M.C., has died in hospital at Boulogne from a wound received whilst carrying out his duties.

THE BROTHERS BASHALL.

VERY little has been heard of "Bizz" and Harry Bashall since the war began, though we knew that they were both "doing their bit" over in France. They are now attached to the 2nd Indian Cavalry Supply Column of the M.T., A.S.C., "Bizz" driving a Clyno sidecar and Harry a Sunbeam car. Like many others, they have not had leave yet, though both have seen over a year's service.

NO MOTOR CYCLES IN MACEDONIA.

A REPORT reaches us from a reliable source to the effect that no motor cycles are now being used in Macedonia on account of the very muddy condition of the country, as well as the absence of roads. Despatch riders are now using pedal cycles, and motor cyclist officers are mostly engaged upon signal work. Probably when the weather improves and roads of some sort are formed, motor cycles will be used again, for it is certain that where push cyclists can ride motor cyclists can follow.

Lieut. G. I. Francis sends a service postcard, with the words "A Happy New Year to All" written across it.

We understand that Gordon W. B. McKechnie, a member of the Motor Cycling Club, who received a commission some time ago in the M.M.G.S., and has seen active service, is being transferred to the R.F.C.

Corporal "Bizz" Bashall driving a Clyno outfit somewhere in France." Together with his brother Harry he is attached to the 2nd Indian Cavalry Supply Column of the A.S.C., M.T

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," Hertford Street, Coventry, and must be accompanied by the writer's name and address.

Tyre Repairs.

Sir,—I was much interested in your article on Mustikon inner tube patching, as indeed I am in most of the articles in *The Motor Cycle*. It has reminded me of the musiroom type of solid rubber plug used in the repair of the single tube tyres used long ago on pedal cycles, the head of the plug being passed through the puncture and the projecting end trimmed off flush with the tread of the tyre. Possibly these plugs could be used in the repair of holes in outer covers of motor cycle tyres if they could be obtained, at least as a temporary repair. I may add that most of my tyre troubles have been through punctures near the valve, which, I hope, will be capable of easy repair by the Mustikon process. BATITE.

Varying the Power of Electric Light.

Sir,—I think the cheapest and simplest way out of the difficulty is to use a small variable resistance (wire) in series with light and battery. This article costs about 1s. 6d., and can be purchased at any electrical stores. If used with a dynamo set, care should be taken to connect it between the light leads and not between dynamo and battery, as this would cause the dynamo voltage to drop (when charging), and therefore the voltage of battery being higher, it would try to run the dynamo as a motor. This would not improve the condition of the aforementioned articles. This would enable the lights to be varied at will from zero to full without involving the complications of double filament bulbs, or connecting an accumulator to a two-way switch to tap off two, four, or six volts as needed. Again, say on a run through country and town (especially in winter weather), one does not want to stop to substitute a bulb of higher voltage to get the desired light. X.Y.Z.

Motor Cycles in Gallipoli.

Sir,—Your readers may be interested to hear a little more about the motor cycles in Gallipoli. Though not very many are used for communications from the beaches to the firing lines, yet a good many are used in communications between the various beaches, and from G.H.Q. to various brigade headquarters. In the Krithia sector the machines are Douglases and countershaft three-speed Triumphs, the former used by the R.N.A.S. and the latter by the Army despatch riders.

On our beach there was a steep and precipitous path leading from the shore to the top of the 100 feet cliffs, and it was really wonderful to see the way the Triumphs climbed it. Starting only twenty yards from the foot of the climb, the average grade of which must have been at least 1 in 4, they would fairly roar up, accelerating all the way, in spite of dust and sand from 2in. to 6in. thick. The only trouble ever experienced with them was broken springs in the forks owing to the terribly rough roads.

The Douglases were not quite so good at climbing, but stood up to their work wonderfully. I met one as early as last May, being driven through the bed of a stream in the Saghir Dere, before ever the present road there was constructed. It was being bumped over rocks and holes, and was dripping with water, yet it hummed on as though on an English main road.

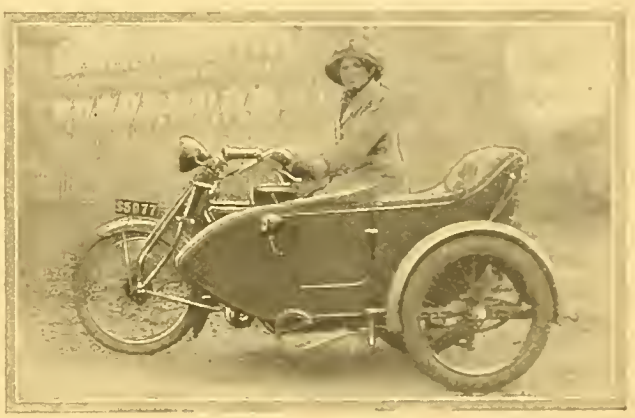
The only other machines I have seen were half a dozen B.S.A.'s at a depot at Suvla Bay. In that region one could enjoy (as much as shrapnel, etc., would allow) a blind of a couple of miles all out across the fairly level dried mud of the Salt Lake.

I have had your paper sent out to me every week, and both on the Peninsula and here in hospital there is always a rush for it as soon as it appears. I can truthfully say it is the only paper I ever read from cover to cover.

Malta. 1608, R.A.M.C.

Useful Hints on Dress to Lady Motor Cyclists.

Sir,—I am a constant reader of *The Motor Cycle*, and if you will allow me space I can give lady motor cyclists a few hints on how to make a very neat skirt for motoring. I took an old-fashioned skirt with eight gores and rather wide, and opened it up the left front and the left back and sewed it up like a divided skirt. I can go into any shop, or walk in it, and it never looks a bit divided, being so wide round the bottom, and it is heavy round the bottom and does not blow about. My coat is threequarter length, knitted of the same colour of wool. The first time I was out on the motor I felt the wind very much on my chest, so the next thing was what I call a chest protector, cut out of leather and covered with velvet coming up well to the neck; this I pen painted, and it just looks like the front of my blouse, and is quite warm on the coldest day. My hat is made to come down over the ears, but I can hear quite well; it is fastened under the chin with a ribbon and spring button.



Miss Jeanie Kerr, of Thornton, Fife, and her 7-9 h.p. Matchless sidecar. (See letter on this page.)

I enjoy motoring of all kinds, and can drive a motor car, motor lorry, or a motor cycle, but I use most a 1915 7-9 h.p. Matchless cycle and sidecar. I have had no trouble with it while doing long journeys. Sometimes I have one or two passengers in the sidecar and sometimes I am alone, but it is very easy to steer, only one must remember to have a bit of the road for the sidecar. It is fitted with all the newest patents and electric light. I have covered many miles on this cycle in all kinds of weather. One ride to be remembered by me was on a night of torrents of rain, thunder, and lightning, but weather does not trouble me with my sou'-wester hat and coat. All went well until I reached a street in K——, which was flooded. The lady in the sidecar wanted to turn, but on I went. Before I got far the water was up above the first rest, so I had to remove my foot to the second rest, and five minutes later we left that street behind, none the worse for our trip through the water.

JEANIE KERR.

Scott Lubrication.

Sir,—Capt. Dodds's letter and illustrations in reference to his 1913 Scott and sidecar are very interesting.

I think the Best and Lloyd twin feed which he has adopted quite good. At the same time I cannot very well understand why he should have experienced any difficulty in obtaining an equal share of oil to each cylinder with the single drip-feed and pressure pump (as fitted by the Scott Engineering Co.), provided the crank case suction is equal and lubricating pipes clear.

I have used the standard single drip-feed for the past two years, and have always found the level of oil in each crank case sump to be approximately the same; and I cannot say that I have experienced a semblance of a seizure. My mileage is approximately 12,000, and I frequently carry two passengers in the sidecar.

I notice Capt. Dodds's machine has not quite all the latest improvements, viz., front forks. I ride the same model as Capt. Dodds, and I find the 1916 forks a great improvement compared with the 1914 pattern. My petrol consumption is 52 to 60 m.p.g. with Binks three-jet carburetter.

I must endorse Capt. Dodds's remarks on the comfort experienced in riding a Scott, and, like himself, I have ridden a few other makes. I have toured from one end of England to the other with two passengers on two occasions with absolutely no mechanical trouble. For positive reliability these machines cannot surely be surpassed. I should say I am in no way interested in the Scott Engineering Co. other than being a satisfied rider of their machine.

C. B. THWAITE.

British Machines for British Riders.

Sir,—*The Motor Cycle* circulates pretty freely among despatch riders on this side, and five of us have just been discussing your big production of November 25th. It is a splendid effort, but do you not think that, considering the large circulation your publication enjoys, far too much publicity is given each week to American-made machines, for publicity usually results in sales? American manufacturers have pushed sales strongly in Great Britain at a time when our manufacturers are at a disadvantage, engaged as they mostly are on Government work.

Judging by the prominent and expensive advertisements, the American firms, or their agents, indulge in, they must be selling some machines in Great Britain, and where they have sold machines they will sell parts for subsequent replacements. Result, as our old friend Micawber would say, more money for the United States of America.

If British-made motor cycles were sold in the States we could, in normal times, afford to reciprocate by purchasing American-made motor cycles; but where in the United States, with the possible exception of the experimenting department of some of the motor cycle manufacturers, can one find British-made motor cycles? They are not to be seen on the roads, nor are the advertisements of British cycle firms to be found in the motor cycle publications in the U.S.A., for the tariff on motor cycles (50%, as far as the writer remembers) prohibits the British manufacturer from competing. The 33⅓% duty imposed on American machines and parts by Mr. McKenna should be the same as on British machines entering the States. At this time, however, when the British Empire is fighting for its very existence against an organisation largely created by money derived from profits on goods dumped into Free Trade Britain, and every sovereign, whether in the possession of the State or the individual, is of vital value to the Empire and civilisation, no one should be instrumental in allowing even the smallest sum of money to leave the country, unless it be in payment for some necessary article not procurable in the Empire, and, with the wide range of British models to choose from in Britain, the purchase of a foreign-made motor cycle at present should be considered unpatriotic.

CUCKOO (Despatch Rider).

1st Canadian Contingent B.E.F., France.

Mrs. Attwood and her lady's model Douglas. (See letter on this page.)

The Lady Motor Cyclist—A Protest.

Sir,—I wish to endorse the remarks of Miss Mary Reid in your issue of December 16th in regard to ladies' motor cycles. I may say I have ridden a lady's motor cycle for the last four years, and have disposed of my old motor cycle every year without any difficulty at all.

As regards speed capacity, I am certain it will travel as fast as anyone would desire.

Having this year disposed of my 1914 machine I waited six months for delivery of a new lady's Douglas in preference to riding a man's, although there was always one at my disposal. I think and hope that ladies will take to riding ladies' machines instead of men's, as it is much more becoming. As it is with ladies' push cycles, so it should be with motor cycles.

(Mrs.) R. H. ATTWOOD.

Sir,—"*Pro Bono Publico*," in your issue of the 9th inst., is amusingly illogical and unconsciously humorous.

It is safe to assume that "P.B.P." is a "he," because it is only a man who would make the distinctions in the three instances he gives—the first being an "elderly female," the second a "younger woman," and the third a "youthful rider."

He ridicules the "elderly female" for wearing a "waistless mackintosh" jacket, heavy boots, huge spectacles, and aggressively obtrusive headgear. The "younger woman" is guilty of wearing "an ordinary common (very common) peak cap anchored down by a skewer, and reminding him of washing day in the back kitchen." The "youthful rider of the Rudge" pleases him with her well-cut riding breeches, etc., but she evidently wears no headdress or "P.B.P." would give us his impression of it, as he did in the first two instances.

It is clear that the age of the ladies has distorted "P.B.P.'s" judgment, but unless the "elderly female's" headgear is so obtrusive as to brush "P.B.P." or others off their mount when passing, or so aggressive as to frighten horses; or the "younger woman's" "skewer" projects so much that "P.B.P." is in danger of being transfixed or losing an eye by it, he has no right to complain.

It is probable that neither the elderly female nor the younger woman can afford "well-cut riding breeches," but "P.B.P.'s" ethics make no allowance for this, and he reminds me of the Irish railway manager who separated his lady passengers in waiting rooms labelled as follows:

First and Second Class waiting room for Ladies.
Third Class waiting room for Females.

These inscriptions remained until ridicule had its effect on him. "P.B.P." would appear to be a reincarnation of this long departed railroad philosopher.

You print a photograph of a Miss Blackiston under "P.B.P.'s" letter, and I do not think any dress could be more efficient for motor cycling, nor any dress more pretty,

than this lady's. The first use of clothes is to keep in heat and keep out rain, and Miss Blakiston's will do both. What more is wanted? It was woman's vanity first put frills and fol-lols on her dress, and it was done to please the "lords of creation." She has floundered about too long in wind-catching, muscle-binding draperies, adopted merely to obtain graceful and pretty effects for her "lord's" approval.

The *fin mot* of "*Pro Bono Publico's*" reasoning is that when a lady motor cyclist is *young* it is immaterial what she wears on her head: when she is older she becomes a *woman*, and her headgear is subjected to biting criticism; but later on in life the poor lady becomes a *female*, whose headdress is not only distasteful, but absolutely dangerous; therefore, the only "way out" for the lady motor cyclist who wishes to adopt a rational dress is either to retain her youth *ad infinitum*, or to strengthen her mind to stand the storm of ridicule which the lords of creation will let loose on her.

LOGISTES.

Two-stroke Lightweights—A Criticism.

Sir,—I have recently been conducting some experiments with different makes of two-stroke machines, and have bought three well-known machines of different makes and engaged a really capable rider to test them. I have been really astonished by the reports sent in of the efficiency of the engines but of the absolute inefficiency of the machines in other respects.

The conclusions based upon the reports are that it is impossible to use any of these machines in the kind of weather we have been having lately. The mudguards are hopelessly inefficient, the result being that a stream of mud and water deluges the engine, carburetter, gear box, and belt. The result of this is that all the working joints get worn out in a week or two's riding, and that the machines cannot be driven on account of the belt slipping owing to the slush and water on it. On more than one occasion the driver has had to put the machine on the train as it was impossible to get on at all. In the case of a chain-driven machine the mud and wet getting under the chain caused it to break on several occasions.

The journeys referred to were all the same, namely, from Manchester to the Lake District and back. Two of these machines are fitted with rim brakes on the back wheel which are perfectly satisfactory; the other machine has band brakes, one of which actually wore the drum on which it worked clean through, on three journeys. To mitigate this trouble as far as possible I have had one of these machines fitted with a screen right underneath the power unit. This screen extends right back, and the belt runs in it. The effect of this arrangement is completely to revolutionise the running under these adverse conditions and improve the comfort immeasurably.

I enclose you an illustration of this machine, from which you will observe the top of the belt is unprotected, but this does not seem to matter, as the rider protects this. It is the bottom portion of the belt which seems to collect all the wet.

You will observe from the illustration that this machine is fitted with a hot air supply to the carburetter. In my opinion no two-stroke machines should be turned out unless they have a thoroughly efficient hot air service. This particular machine is fitted with one of my three-jet carburetters, and, under the very unsatisfactory road conditions, will average 130 to 140 miles per gallon with practically an absence of any four-stroking.

Take the hot air pipe and muff off and the mileage is 20 m.p.g. less, with nothing like such good running. Apparently, it would seem that to enable these modern lightweights to be ridden in really bad weather, very much more ample protection from the mud and rain is an absolute necessity.

C. BINKS, LTD.,
CHAS. BINKS, Managing Director.

Spring Frame Design.

Sir,—Lately I have noticed that in several new spring frames the inventors endeavour to coincide the pivot of the lower movable member with the axle of the gear box. Theoretically, they are right as regards the variation of distance between the axle of the wheel and the axle of the gear box; but, practically, it is preferable to place the pivot slightly behind the countershaft gear.

In the first place, the construction is more rigid and more simple; besides that, the variation of distance is so small that it can be neglected.

Consider an elastic frame allowing a movement of the wheel of 10 cm. Suppose that the distance from the axle

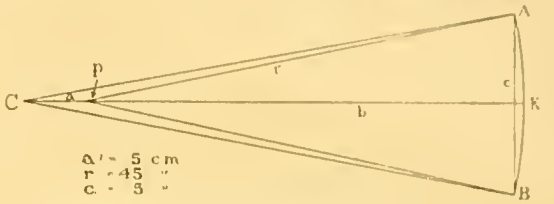


Diagram showing the variation in the distance between the driving centres of a spring frame.

of the gear box to the axle of the wheel be 50 cm., and from the pivot P to the wheel 45 cm., the variation will be at a minimum in so far that P is situated on the bisection of the angle A C B, the arc A B representing the movement of the wheel.

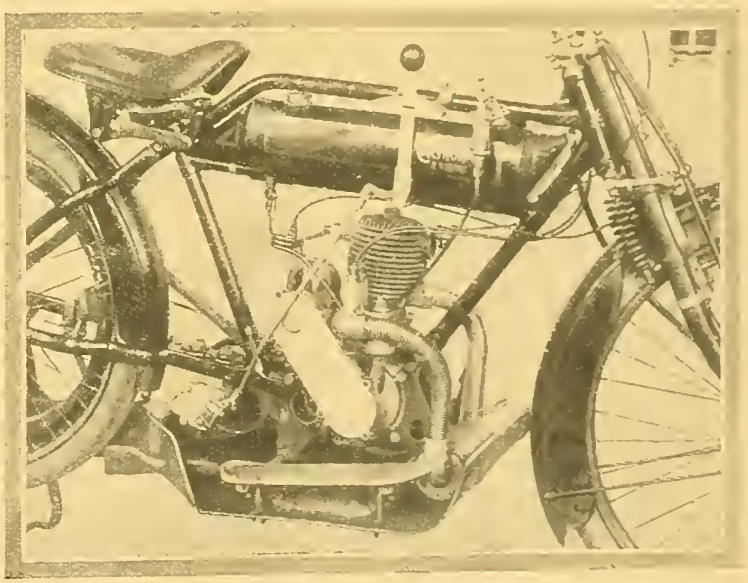
Then if PA = r = 45
CP = a = 5
PD = b
AD = c = 5
AC = R_1
CK = R = 50

The variation of distance is—

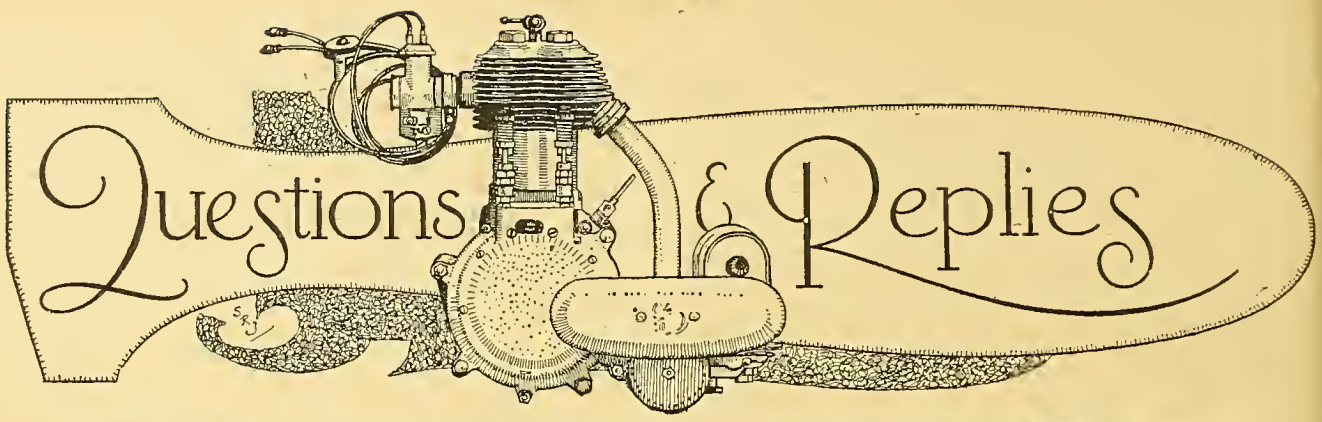
$$R - R_1 = R - \sqrt{(a+b)^2 + c^2}$$
$$= R - \sqrt{(a + \sqrt{r^2 - c^2})^2 + c^2}$$
$$= 50 - \sqrt{(5 + \sqrt{45^2 - 5^2})^2 + 5^2}$$
$$= .028 \text{ cm.}$$

that is to say, about eleven thousandths of an inch. Thus, one sees that this variation is practically nil when the pivot P is placed on the bisection of the angle A C B.

M. VAN GEERT.



A two-stroke lightweight, improved (as described in the letter from Mr. C. Binks on this page) by the addition of an underscreen and a hot air intake to the carburetter.



A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, London, E.C., and whether intended for publication or not **must be accompanied by a stamped addressed envelope for reply.** Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy, for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

Fitting a Brake.

I have just taken my machine to pieces, and am about to put it back again, but am doubtful whether to put the brake to pull on the top side of belt rim or not; it was on the under side before. Does not the top side grip better? I notice most makers fit the brake shoe on the under side. Is there any undue strain caused by fitting it on top?—J.S.L.

You had better fit the brake so as to pull on the under side as it was before. If you have the brake shoe to fit on the top side it would probably have a greater jamming action, whereas on the under side it would provide sufficient braking power and yet would not be liable to skid the wheel.

A Leaky Float.

(1.) I find there is some petrol in the float of my carburetter, and when it is immersed in *hot* water bubbles slowly appear from a joint. Will this make any difference to the petrol consumption? If so, how can it be got out? (2.) Would it be possible for me to fit a chain drive to my 2¼ h.p. two-stroke, as I find the belt drive such a trouble owing to the small diameter of the driving pulley?—G.E.G.

(1.) Boil all the petrol out (this should be done by submerging the float in very hot water), and then solder up the joint where the leak is, as shown by the bubbles which appear. Otherwise the carburetter will always be flooding. This will increase the consumption, and will eventually stop the engine. (2.) It would be possible to fit chain drive to this machine, but it would be a difficult and rather expensive matter. Belt drive should be quite satisfactory if the pulleys are of the correct size. You might try using a flexible leather belt, but a leather belt is more messy and rather more troublesome than a rubber belt. Still, it grips well round a small pulley, and is better than a rubber belt in wet weather.

Gear Ratio.

(1.) Is a 6½ to 1 top gear too low for a 3½ h.p. Minerva fitted with a light coachbuilt sidecar, as I am only able to get about 17 m.p.h. out of the machine? The low gear has a 45% reduction. (2.) Is oil or grease the more suitable for a Toroga gear box, ball clutch type?—V.M.

(1.) We should think a 6 to 1 gear about right for this machine when propelling a sidecar, but your engine obviously requires tuning up. You must be contented with low speeds, otherwise you will cause the engine to overheat. (2.) Thick gear oil is usual with sliding type gears.

A Loose Bearing.

(1.) On taking my engine down for cleaning I find that the bush in the big end of the connecting rod is loose. It moves round, but not up and down. Should this be fixed? (2.) I also see that the small end is tight, but there is a very slight up-and-down play in the gudgeon pin itself. Will this cause the engine to rattle, or what will it do? (3.) The agents tell me that my engine has a high compression, and it is awkward to turn the engine over; in fact, I cannot do it unless I inject paraffin, and then it is quite easy, and when it is warm I only push the pedal down and away it goes. I have tried several brands of oil. Could you make any suggestion as to this? I give the engine one pumpful every five miles. Is this correct? (4.) I have the offer of some oil which is used for steam engine and generator combined. It looks just the same as motor oil. Do you think it is worth trying? (5.) I thought of putting some baffle plates in my silencer, as the engine is rather noisy. Would they make it quieter, or would they cause any back pressure?—W.H.T.

(1.) The bush should be fixed in the connecting rod. It should be a driving fit, and is frequently pinned in addition. (2.) If the up-and-down play is only very slight you can probably run the engine for a time without having this bush secured. If, however, it causes excessive noise it is time it should be seen to; in fact, it would perhaps be wise to have it fixed at once. (3.) You should inject paraffin or petrol before starting in cold weather, as the oil becomes congealed, so causing the engine to be stiff to rotate. Half a pumpful every five miles should be enough. (4.) Only use good oil suitable for air-cooled engines. The oil suitable for steam engines would hardly be suitable. (5.) Probably extra baffle plates would cause back-pressure in the silencer. What you want is a fairly large expansion chamber, and a reasonably long exit pipe with a flattened end.

Contact Breaker Adjustment.

I have a single-cylinder motor cycle fitted with a Bosch DA2 magneto, which I have just had completely renovated, and when refitted to my motor cycle I found it would only spark from full retard to half advance. I examined the contact breaker, and found the new platinum points breaking nearly ⅛in. apart. I adjusted them until they parted 1 mm., and now I get a splendid spark from half to full advance, but a poor spark at full retard, and that only when turning over fast. I also find that the platinum points only remain open for about one-thirtieth of a revolution now, whereas before they remained open for one-third of a revolution. (1.) How long should they remain apart? (2.) How can I reduce the gear? I have an adjustable pulley giving gears from 3½ to 1 to 5¼ to 1. I want a lower gear, say 6 to 1.—B.M.S.

(1.) We should recommend you to adjust the points so as to break .4 mm., which is, roughly, that of a visiting card. The magneto spanner contains a gauge of this thickness. The points should remain open during the whole period that the fibre heel of the rocking arm is resting upon the cam. (2.) The only way of reducing the gear further is to fit a larger belt rim.

SPECIAL NOTICE.—*Copies of "The Motor Cycle" may only be sent to neutral European countries if posted direct from the offices of the publishers, or by newsagents who have obtained permission from the War Office for this purpose. The publishers of "The Motor Cycle" have obtained the necessary permission, and, consequently, can send subscribers' copies as usual. Before sending through newsagents it is important to enquire if permission has been obtained, as otherwise copies intended for neutral European countries will not be forwarded by the Post Office.*

Broken High Tension Wire.

[?] If the H.T. wire which joins the magneto to the sparking plug is *partly* severed, will the machine continue to fire at all? One day as I was out with my brother, we stopped, and, on restarting, the machine would fire about five times and then stop, and eventually refused to fire at all. After a great deal of trouble we discovered that, although the rubber covering of the wire was not even cracked, the wire itself was severed. After joining it up the machine fired again with all its old vigour. Just before it stopped completely it was firing perfectly regularly.—R.E.L.

Yes, as long as there is a strand of wire the engine will continue to fire, or even if the wire were broken and there was a gap of ⅛in. the spark would jump the gap and the engine would still fire. In a case like that quoted in your letter it is obvious that there was a break in the wire, and probably the break was insulated by a piece of rubber between the severed strands, otherwise the high tension current would easily jump the gap.

Difficult Starting.

[?] (1.) I have considerable difficulty at times in starting up my 3½ h.p. single-cylinder from cold without injecting a considerable quantity of petrol. (2.) The petrol consumption is also very high, only 60 to 70 m.p.g. of No. 2, although the engine does not overheat and I can climb quite steep hills easily solo on top gear. (3.) After the engine has been running well for several miles it suddenly misfires for a few yards, then fires regularly for a few minutes, when it will stop altogether. I have cleared the petrol pipe and the carburetter and found no trace of dirt nor any air lock. There also does not appear to be sufficient acceleration when the magneto is fully advanced, although the timing is in accordance with the accepted theory—points of magneto just breaking with piston on top and the lever set half-way between full advance and full retard. The valve timing also appears to be correct.—D.B.H.

(1.) Difficult starting is nearly always due to too much air reaching the carburetter at slow speeds. This may be caused by too small a jet, a worn throttle slide, or a worn inlet valve guide, or to an air leak at the induction pipe union. (2.) The petrol consumption is certainly rather high, but if you try and economise it is quite possible that you will upset the running of the engine. (3.) Be sure and use a sparking plug of the single point type made by a first-class manufacturer. The possible trouble is pre-ignition, caused by an unsuitable plug.

A Formula for Horse-power.

[?] Would you kindly give me the particulars for calculating the approximate horse-power of a motor cycle engine?—W.H.T.

There are several formulæ for calculating the horse-power of a motor cycle engine. None of these, however, is particularly satisfactory. A good idea of what we mean can be obtained on referring to page 154 of the current edition of "Motor Cycles and How to Manage Them" (which can be obtained from these offices, price 1s. 3d. post free, or from any bookstall). It will be seen that the horse-power by formula of a 3½ h.p. engine varies from 3.83 to 6.36. A 500 c.c. engine is called 3½ h.p., but as much as 5 h.p., if not more, can be got out of it. Perhaps one of the best formulæ is the Hospitalier, $\frac{R^2 S N \text{ revs.}}{75{,}000}$ R = radius of cylinder, S = stroke (both in cm.), N = number of cylinders, revs. = revs. per minute. A simpler method is to reckon 1 h.p. for every 100 c.c. of capacity.

READERS' REPLIES.

Easy Starting.

I have noticed each week in your valued journal, letters complaining of difficulty in starting engine, and I will relate my experience. I own a big 5-6 h.p. almost new single-cylinder outfit, carrying about 32 stones, and I had great difficulty in starting. There was fitted a decompressor, through which I could inject petrol. The trouble I attributed to the oil in cylinder. I tried for days to find a way of getting over the trouble, without much success. At last I came across a K.W. sparking plug, which is fitted with a tap for injecting petrol. By injecting petrol in plug and decompresser I now have no trouble. While writing you, I would mention that I have been looking out for a coachbuilt tandem side car, but can find none to suit me. One firm is making one with two separate doors, and this is a move in the right direction. But the trouble is the length. All firms appear to make the body 6ft. This looks too cumbersome. I consider 5ft. plenty, and am looking for one of this length. I recently fitted a spring attachment to my wicker pillion seat, and my passenger finds this a great comfort. On the tyre question, all my three tyres are 650×65 mm. Belts I discarded for all chain drive years ago. The improvements I desire to my present mount are: (*a*) Three detachable, interchangeable wheels; (*b*) engine cylinder that can be dismounted without taking engine out of frame.—G.E.

EXPERIENCES WANTED.

"D.L." (Glasgow).—Junior Triumph. Reliability, speed, and general running.

"Douglas" (Paisley).—Philipson pulley on 2¾ h.p. T.T. Douglas. Also suitable sidecar for same machine.

"H.M.H." (Halstead).—Cowey trip speedometer. Accuracy (both speed and mileage record), steadiness of indicating hand, and general reliability.

RECOMMENDED ROUTES.

LONDON TO MORETON-IN-THE-MARSH (avoiding Oxford).—P.G.T.P.

London, Uxbridge, Gerrard's Cross, High Wycombe, Weatley, Islip, Bletchington, Chipping Norton, Moreton-in-the-Marsh.

LARKHALL TO BATH.—J.R.

Larkhall, Abington Inn, Beattock, Lockerbie, Ecclefechan, Carlisle, Penrith, Kendal, Lancaster, Garstang, Preston, Wigan, Warrington, Tarporley, Whitchurch, Wellington, Bridgnorth, Kidderminster, Worcester, Gloucester Painswick, Stroud, Nailsworth, Bath.

CHATHAM TO TAUNTON.—W.M.H.

Chatham, Aylesford, Wrotham Heath, Ightham, Seal, Westerham, Redhill, Reigate, Dorking, Guildford, Hog's Back, Farnham, Alton, East Tisted, West Meon, Bishop's Waltham, Botley, West End, Totton, Cadnam, Ringwood, Wimborne, Blandford, Newton, Sherborne, Marston Magna, Langport, Curry Rivel, Taunton

SOME RUSSIAN DESPATCH RIDERS. The men shown are attached to a squadron in which there are sixty machines, all Indians, and they have been in use on the Eastern Front for over a year.

Bowden Wire's New Address.

We understand that the head offices of Messrs. Bowden Wire, Ltd., have now been removed to their new factory at Victoria Road, Willesden Junction, N.W.

What War Means.

We have received a Christmas card from R. W. Coan, 219, Goswell Road, E.C., the well-known aluminium founder, regretting that owing to scarcity of aluminium he is unable to send the usual artistic aluminium souvenirs which it has been his custom to send out to his clients in the past.

Blumfield Engines.

At present Blumfields, Ltd., are so busy on munitions as to be unable to pay much attention to the manufacture of motor cycle engines. Fortunately, however, they are still in a position to supply a limited number of their single-cylinder 80 mm. × 95 mm. engines.

20,000 Miles on One Tyre.

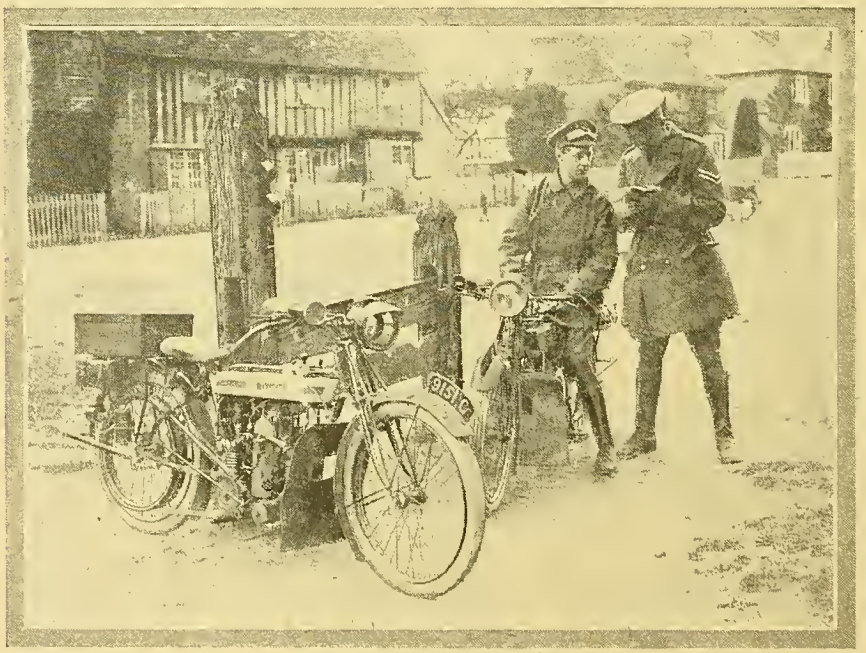
We recently had the opportunity of examining a J.P. motor cycle tyre which, guaranteed for 3,000 miles, and supplied in 1912, had just come to grief after having been used for 20,000 miles, according to the owner's statement. The tread of the tyre was in remarkably good condition before it burst.

Catalogues Received.

"Ariel Spare Parts." Ariel Works, Ltd., Bournbrook, Birmingham A new catalogue of spare parts and replacements, copies of which may be had on application to the makers. It is very complete, and every part is illustrated and numbered to facilitate quick reference.

We are in receipt of a booklet entitled "The Villiers Two-stroke Motor Cycle Engine," from the Villiers Engineering Co., Ltd., Blakenhall, Wolverhampton. One of the chief features of the book is the spare parts list. As the engine is a two-stroke there are not many working parts, but all of these are illustrated, described, numbered, and priced, enabling the spare part to be ordered without any possibility of error.

We are in receipt of a catalogue from Messrs. John Piggott, Ltd., 117, Cheapside, E.C., entitled "For the Services and Civilians: What they want and where to get it." It contains many articles of motor cycle clothing which are eminently suitable for wear by soldiers and sailors. For instance, many leather waistcoats, thick gloves, and other articles formerly used chiefly by motor cyclists are now bought in large numbers by members of the sister services.



ANCIENT AND MODERN.

Despatch riders in training studying the map by the side of the old stocks at Aldbury.

F.N. Repairs.

Those desirous of having repairs carried out to F.N. motor cycles, or who desire to order spare parts for these machines, should address their enquiries to the Efenmo Works, Kimberley Road, Willesden Lane, N.W.

Increase of Prices.

On and after January 1st all Norton models will be increased in price by 5%. At present this applies to only a few machines, but in consequence of still further increases in the cost of raw material the 5% advance will be extended to all as from the date mentioned.

War Funds Subscriptions of the B.S.A. Employees.

Soon after the outbreak of war the employees of the B.S.A. Co. organised the B.S.A. Employees War Fund, and the amount subscribed for the first twelve months, as shown by the balance-sheet recently issued, is practically £7,000.

In Aid of the Red Cross.

We are in receipt of a handsome almanac for 1916, issued by Messrs. Abdulla and Co., the cigarette specialists of 60, New Bond Street, W. The page for each month is beautifully illustrated by means of the reproduction of a painting by some well-known artist. Copies are to be sold at 1s. each by Messrs. Abdulla and Co. for the benefit of the British Red Cross Society.

Armstrong Gears.

Some difficulty has been experienced in the past by many riders in finding a firm who can supply spare parts of Armstrong gears or undertake repairs thereto. It is, therefore, interesting to announce an addition to the short list of firms able to do such work. The firm is Messrs. W. B. James and Co., Leyland Terrace, School Lane, Leyland, Lancashire.

Reviews.

"The Maintenance and Repair of Motor Cars." (Iliffe and Sons Ltd. 2s. 6d., 2s. 9d. post free.) A useful handbook written by a motorist of many years' experience, who is an owner-driver. A careful study of this book will enable anyone with an average mechanical knowledge to master the details of a motor vehicle, and take entire charge of it with confidence. Each chapter of the book deals with a separate portion of the car, such as the engine, lubrication, ignition, transmission, tyres, etc.; consequently the information contained can be easily assimilated without the least possible trouble, and wherever possible doubtful points are illustrated. This book is of almost as much interest to the motor cyclist as to the car driver.

MOTOR CYCLES FOR SALE.

B.S.A.

B.S.A., 1916 models in stock for immediate delivery; 4¼h.p., 3-speed countershaft gear, chain and belt drive, model K, £62; model H, all-chain drive, £64; liberal exchange or extended payment terms.—Elce and Co., 15-16, Bishopsgate Av., Camomile St., E.C. [0597

Calthorpe.

CALTHORPE Junior, 2h.p., 2-speed; 16 gns., lowest, spot cash.—Potter, Cama View, Gosport Rd., Fareham, Hants. [X7878

1915 Calthorpe-Jap, 2-speed, shop-soiled; 28 gns.; very great bargain.—Julian, Broad St., Reading. 'Phone: 1024. [X4886

CALTHORPE, Latest 2-speed lightweight models in stock; cash or exchange; no waiting.—Eagles and Co., High St., Acton, W. [X7913

CALTHORPE, latest 2-stroke, 2-speed, just arrived from works; immediate delivery; £31/7.—Wilkins, Simpson, and Co., 11, Hammersmith Rd., London. [7943

1915 Calthorpe Junior, 2 speede, new, £21, offers, or sidecar, N.S.U. 2-speed gear, and speedometer as part.—Morley, 11, Grindell St., Hedon Rd., Hull. [X7874

CALTHORPE, latest J.A.P., Enfield 2-speed, just arrived from works; immediate delivery; £36/15.—Wilkins, Simpson, and Co., 11, Hammersmith Rd., London. [7942

CALTHORPE-J.A.P., 1915, Enfield 2-speed gear, £29/10, Lucas accessories; deferred payments.—Lamb's, 151, High St., Walthamstow, and 50, High Rd., Wood Green. [7969

CALTHORPE Junior, 1914, 2-speed, excellent condition and running order; £17.—Tuke and Bell, Ltd., Motor Dept., Carlton Engineering Works, High Rd., Tottenham, N. [7621

Campion.

1916 Campion Combination, 6h.p. J.A.P., 4-speed Jardine chain-cum-belt, 650×65 tyres, all black and gold-line finish, fitted up superb, Lucas lamp set, gas or electric same lamp, Lucas sidecar lamp set, electric rear light, Stewart car horn, Stuart speedometer, Walbro sidecar, screen completely covers passenger, wind cuffs for handle-bars, luggage and petrol grid, mascots, etc., all as new; smartest combination on the road; £85, cost £108; photo and particulars.—Walbro Motor Co., Ely, Cambs. [X7835

Chater-Lea.

1915 Chater-Lea, 2-stroke, 2 speeds, small mileage, like new; cost £40, accept £31.—Thompson and Edwards, West Hartlepool. [X7680

5-6h.p. Chater-Lea, twin, P. and H. lamp, tyres 26in.×2½in., new pulley, less mag., slight repairs wanted; price £8.—21, Alexandra Rd., Leyton, N.E. [7960

Chater-Lea-Jap.

CHATER-LEA, 1911, 6h.p. twin J.A.P., 2-speed P. and M. gear, with large 2-seater coachbuilt sidecar; a bargain, £27/10.—Tuke and Bell, Ltd., Motor Dept., Carlton Engineering Works, High Rd., Tottenham, N. [7620

Chater-Lea-Minerva.

1914½ 2¾h.p. 3-speed Chater-Minerva, specially built, everything the best; £30; only illness compels sale.—Box L343, *The Motor Cycle* Offices, 20, Tudor St., E.C. [7931

Clyno.

CLYNO 6h.p. Coachbuilt Combination, countershaft gear, kick-start, smart turnout; £28.—Speechley, 45, Church Rd., Acton. [X7945

CLYNO Combination, 1913¾, 3-speed, clutch, spare wheel, Binks, recently overhauled, spares, lamps, horn, etc.; £52.—White, 31, Shakespeare St., Southport. [X8021

CLYNO Motor Cycle and coachbuilt sidecar; officer at the Front wishes to dispose of his, spare wheel, lamps, screen, all complete, and in good condition; £70.—To be seen from 9 to 4 at 27, Merton Rd., Kensington. [7925

Dayton.

FOR Sale, Dayton Lightweight, condition practically new; £16.—Charles Simcock, New Inn Yard, Kendal. [X7837

Douglas.

DOUGLAS, 2¾h.p., V, 2 or 3-speed, in stock; from £50/8.

DOUGLAS, 2¾h.p., U, 2 or 3-speed, in stock; from £50/8.

DOUGLAS, 2¾h.p., W, 3 speed, clutch, in stock; £56/14.

DOUGLAS, 2¾h.p., X, lady's, kick-start, in stock; £56/14.

DOUGLAS, 2¾h.p., War Office model, in stock; £54/12.

DOUGLAS Eastern Counties Agents.—The above models in stock for immediate delivery at rock bottom prices; exchanges entertained. Trade supplied.—Tel.: 388. T.A.: Bicycles.—Robinson's Garage, Green St., Cambridge. [6864

1910 Douglas, 2-speed, with lamp, horn, etc.; 19 gns.—Julian, Broad St., Reading. [X5539

DOUGLAS Model U, 2-speed, and footboards, actually in stock; £50/8.—Lamb's, 151, High St., Walthamstow. [7973

CORONET Sidecar Chassis

is designed for long life, and has a wonderful reserve of stability, and is safe on greasy roads. Luggage carrier built into frame. Cannot shake loose, and is a boon when touring.

£10 15s.

Send for illustrated catalogue describing these well known Sidecars.

EXCHANGES.

TRADE SUPPLIED.

We can give immediate delivery of all models, and suitable for any make of machine.

Coronet Sidecars for Harley-Davidsons.

We make a special Sidecar, enamelled French grey to match, 28×3in. tyre, apron to cover entire body, and 4-point attachment £13 10
Immediate Delivery.

7-9 h.p. HARLEY-DAVIDSON.

11J, electrically equipped, 3 speeds £76 13
11F, standard 3-speed model £68 5
Delivery from stock. Exchanges entertained.

NEW 1916 FORDS.

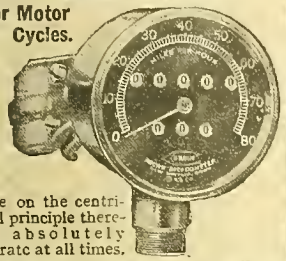
Brown Brothers

Largest Motor Accessories House in the World LTD

The "CORBIN-BROWN" SPEEDOMETER for Motor Cycles.



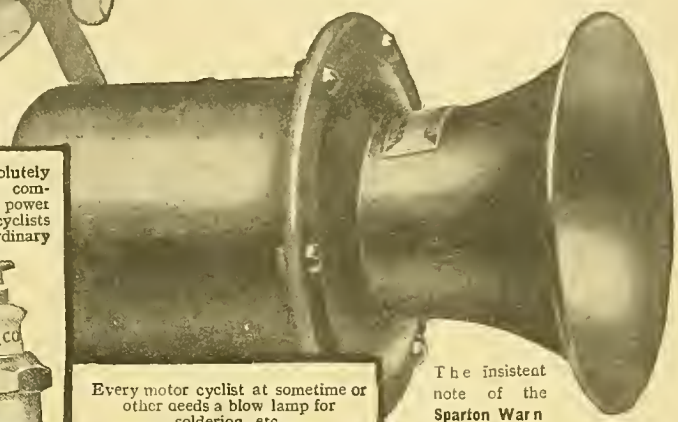
Made on the centrifugal principle therefore absolutely accurate at all times.

Extremely sensitive so that low mileage is recorded as accurately as high.

Supplied for either front or rear drive. Suitable for Indian, Harley-Davidson, Henderson, Excelsior, or *any* make of motor cycle. PRICE 65/-

Complete with fittings.

THE 'SPARTON' WARNING SIGNAL for Motor Cycles.



The insistent note of the **Sparton Warning Signal** instantly secures for you a "right-of-way" anywhere. Its commanding tone is clearly distinguishable from all other sounds, and heralds your approach in an unmistakably effective manner.

Hand operated, 25/-
Finished in all Black.

Write for Sparton Catalogue.

The Accessories illustrated on this page are obtainable from Motor Dealers and Garages everywhere. In case of difficulty communicate with our Showrooms: 15, NEWMAN ST., W.

Are your sparking plugs absolutely gas-tight? If not, every compression stroke means loss of power to the engine. Few motor cyclists suspect the damage that ordinary plugs can do when they leak. Directly the engine attains its normal running heat, the metal parts of the plug expand, causing considerable leakage — the results being overheated electrodes, premature ignition, and consequent engine inefficiency.

AC CICO MOTOR CYCLE PLUGS

ARE gas-tight — under all conditions. Do not continue to run your motor cycle another day with a leaky plug. Get satisfactory service NOW. Put an AC CICO PLUG in your engine and notice the big difference.

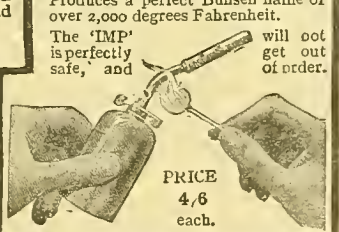
PRICE 2/- each.

Every motor cyclist at sometime or other needs a blow lamp for soldering, etc.

THE "IMP" PETROL BLOW TORCH.

Although small in size, is quite as efficient as a large Blow Lamp. Will heat or solder anything, and is indispensable where quick, clean, cheap, and intense heat is desired. Produces a perfect Bunsen flame of over 2,000 degrees Fahrenheit.

The 'IMP' is perfectly safe, and will not get out of order.

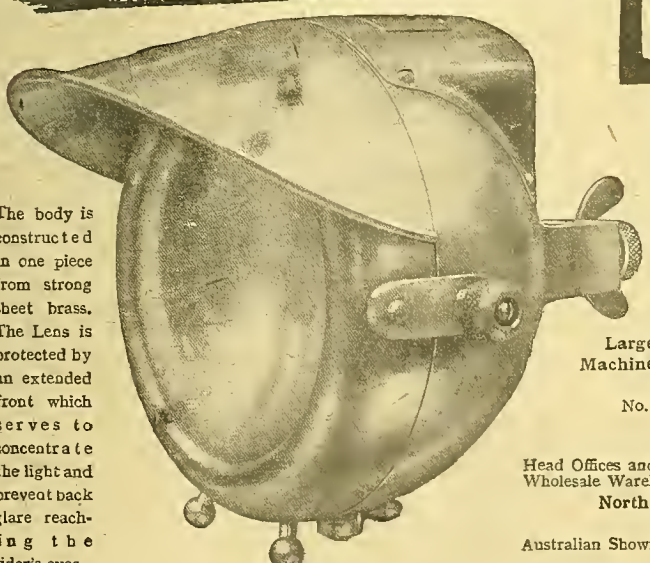


PRICE 4/6 each.

Starts with a match, is entirely Automatic, and burns two hours on one filling.

Autoclipse MOTOR CYCLE LAMPS

REG. TRADE MARK



The body is constructed in one piece from strong sheet brass. The Lens is protected by an extended front which serves to concentrate the light and prevent back glare reaching the rider's eyes.

AUTOCLIPSE LAMPS

are neatly designed, and of superior workmanship, strongly constructed to stand hard wear over rough roads.

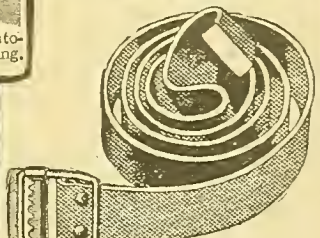
Small size suitable for Lightweight Machines.

No. L60/2, Black Plated, 55/- each.

Large size for Heavyweight Machines or Sidecars, with fork bracket fitting.

No. L60/6 .. 87/6 each.

"Challenge" Waterproof Fabric Straps.



Will outlast, and are much stronger than, the ordinary leather straps. Remain flexible and keep their colour under all weather conditions. Suitable for use with tyre carriers and luggage grids. Supplied in various widths and lengths.

Price from 6d. each.

Descriptive pamphlet on request.

"JAMES"

The JAMES Lightweight

—the junior member of the famous JAMES family—is, like all other JAMES models, essentially a "Quality" machine.

Distinguished both in outline and finish, it is without a serious rival for Town riding, Business or Professional use.
Its low position ensures absolute immunity from skid—it is simple in control and very economical in upkeep—climbs all reasonable hills on top gear and has a speed of 4 to 40 m.p.h.

The 1916 JAMES Range includes—

No. 6, 4¼ h.p. "Big Single," 3-sp. For Sidecar £66-5
or complete with JAMES-CANOELET Sidecar, £14-10 extra.

No. 7. 3½ h.p. Twin, 3-sp., Hand-controlled Clutch. Solo, £66-5

No. 8. 2¼ h.p. Two-stroke, 2-sp., Lightweight, £38-12-6

—and these may all be inspected at the JAMES Agencies to be found in all principal Towns. Don't buy YOUR Lightweight before inspecting the JAMES—catalogue gives all particulars. Send for copy—NOW.

The JAMES CYCLE Co., Ltd., Greet, BIRMINGHAM.
LONDON DEPOT: 22, Holb. Via. B'HAM: Broad St. Corner.

A·J·S

As the designers and builders of the famous A.J.S. we KNOW that OUR machine is far superior in all the multifarious points which together go to make IDEAL Service, but —

From the Prospective Buyer's standpoint, the first-hand evidence of the actual A.J.S. owner will naturally afford the strongest and most conclusive proof of A.J.S. supremacy, hence we suggest —

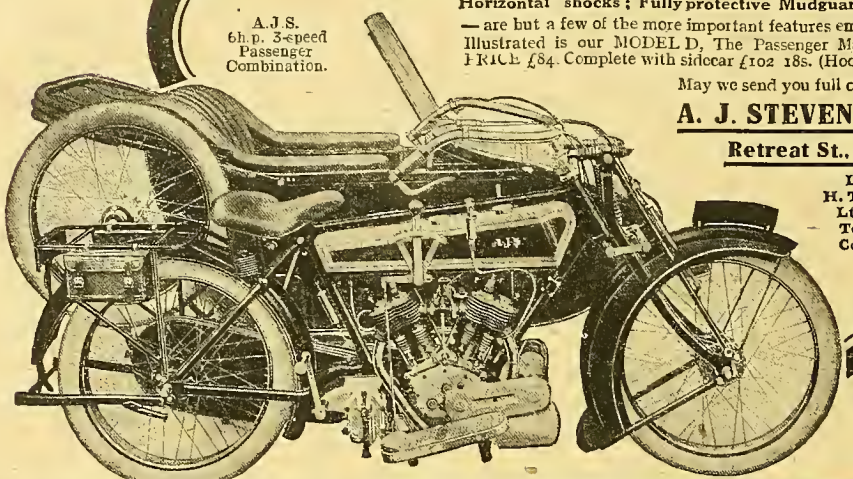
Just "ask the man who OWNS one" what HE thinks of his Mount

A.J.S. Perfected Engine; Interchangeable Detachable Wheels; All-enclosed Weatherproof Chain Transmission: Three-speed Countershaft Gear; Scientific "Straight Tube" Frame; Patent Spring Forks (incorporating wide mudguards) absorbing Vertical and Horizontal shocks; Fully protective Mudguards and A.J.S. Weatherproof Finish.

— are but a few of the more important features embodied in the A.J.S. for 1916.

Illustrated is our MODEL D, The Passenger Machine, 6 h.p. twin cyl., 750 c.c., 3-speed PRICE £84. Complete with sidecar £102 18s. (Hood, Windscreen, and Spare Wheel extra).

A.J.S. 6h.p. 3-speed Passenger Combination.



May we send you full catalogue? It deals with every model.

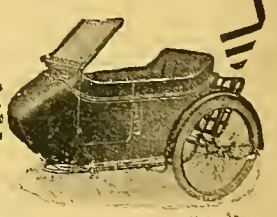
CONVINCING COMMENTS

NO. 3.

"I promised to write you after I had given your De Luxe Model Sidecar a testing. I fitted it to a Chater-Lea No. 7, 8 h.p. J.A.P. I have now done 3,050 miles, and have never had to put a spanner on it since fitting same. "I get nothing but praise from the passengers I have taken out respecting the comfort of it, and the finish and smartness are always remarked on. "I can honestly say the sidecar has given me satisfaction in every way."

Original may be seen at our offices.



Catalogue free from MEAD & DEAKIN, TYSELEY, BIRMINGHAM

In the Service of the King

HONOUR.

TWENTY-FIVE PER CENT. of the skilled workmeo employed in the manufacture of "SPHINX" Plugs are serving in the Fighting Line with wounds and honour. Those who remain behind are serving with equal honour in the daily supply of thousands of "SPHINX" Plugs required by His Majesty's Forces. BECAUSE there is no other firm in the British Empire who for over ten years have made the manufacture of sparking plugs their sole speciality, THEREFORE is their plant, their experience, their organisation, and expert knowledge required n the Service of the King.

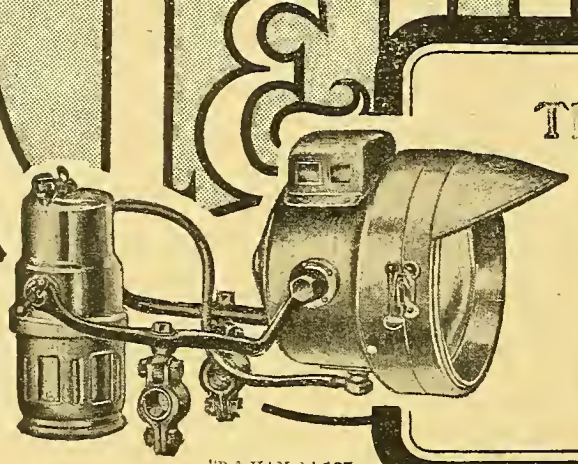
Ask for "P & H"



"P & H" Model 127 (HB.) for handle bar.

The SAFEST way

when buying a Lamp—THE fitment on which so much depends—is to select a make that's widely known and widely used—one, in fact, that has a universal reputation for Quality and Dependability.

The SAFEST way when buying a Lamp is to refuse to speculate, but rather—to ask for "P & H."

Every "P & H" model offered for the 1916 Season will worthily uphold the "P & H" reputation—give the maximum of light—and wear both long and well

When YOU buy, accept no "second best"—no substitute—but choose the SAFEST way and straightway "Ask for P & H."

All Agents stock—Catalogue gives full details of all models, and is free.

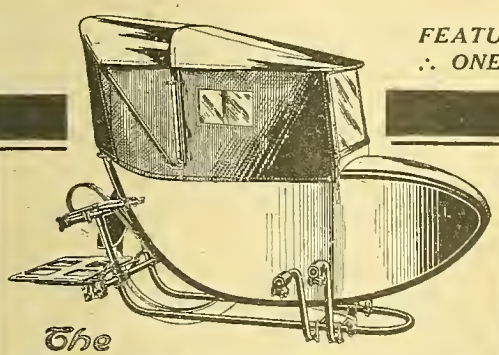
A Famous MotorCyclist and the G·W·K·

It is a significant fact that many motor cyclists, when making the change from their old mount to a light car, select a G.W.K. "The latest convert," says the "Light Car and Cyclecar," Nov. 15th, "is Mr. Hugh Gibson, one of the most prominent figures in the motor cycling world." The choice of a G.W.K. is always well-merited, by reason of its reliability and trustworthiness under all conditions.

FEATURE ∴ ONE ∴



The

HERCULES

CHASSIS

This unconventional picture shows you in the best possible manner the wonderfully simple yet efficient and strong chassis of the Hercules Sidecar. This chassis responds more readily to the movements of the motor cycle, thus eliminating the risk of accident, simplifying steering—especially round left-hand corners—and minimising side strain. The quality of material and correctness of design render this chassis strong beyond all possible requirements and fracture proof. Full details in the art catalogue from

The Hercules Cycle & Motor Co., Ltd., Conybere Street, Birmingham.

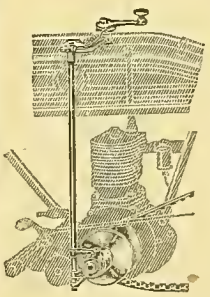
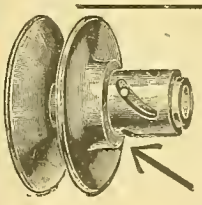
with Free Engine.



- Starts your machine like a car!
- Takes your machine and sidecar up hills impossible without!
- Gets you safely through thickest traffic!
- Ensures safety over greasiest roads!
- In fact, it turns work and danger into a pleasure!
- Just half a turn of the handle on top tube changes from top gear to free engine!

Fitted in two hours to Triumph, Bradbury, B.S.A., Rudge, Precision, T.D.C., Rex, Singer, Premier, etc.



Price - - £3:3:0

for Engines up to 6 h.p. 10/- extra to suit Engines with crank bosses, like J A.P,, old Rex, etc.

Lightweight Model £2 10 0

Here is the curved slot which ensures the belt never slipping on the lowest gear.

Delivery from Stock. Write us to-day for further details. See "Motor Cycling," 23rd Feb.

Beware of Imitations and Infringements

The Grado Manufacturing Co., Pershore St., Birmingham.

Where the battle rages

—there you'll find the CLYNO

—playing its part nobly in the Allies' fight for freedom—daily demonstrating its exceptional efficiency—and by its wonderful war service making a name to be remembered.

AND—while the CLYNO is needed in the theatre of war—while we concentrate all our resources on meeting Government demands for the Clyno Military Combination — other needs must wait.

BUT—after the War—when we CAN supply you with a CLYNO, it will be even a better machine than hitherto, for it will embody the results of the Clyno's war service experience, and—you will then realise that the CLYNO was indeed *worth waiting for.*

The last — although certainly not least — of the

STANLEY

BELT ACCESSORIES

is here shown. So many motor cyclists are familiar with the uses of STANLEY

ADJUSTING HOOKS,

so many have employed them for so long a time, and so often have these little fittings helped a rider out of a bad belt difficulty, that it would appear superfluous to say anything further about them. Still, we are here to explain that they are intended to be used in conjunction with any hook fastener to lengthen the belt by ½in., ¾in., or 1in. as may be required. At a pinch, two or even three could be used together, but in such a case some stout cord should be wrapped round and round in order to provide a grip on the engine pulley.

Made of specially-selected steel, of the right toughness and temper, they will last for years. They cost but **6d.** for the set of three, and should be in **your** toolbag against any emergency.

If there is anything you wish to know about belt drive, WATCH THIS SPACE, or write us direct. Our experience is at your service.

Send postcard for booklet "All in Favour."

Complete DYNAMO SET } 2,000ft. beam, £7 : 7 : 0

F.R.S. DYNAMO WORKS. Pershore Street, BIRMINGHAM.

ALL YOU NEED TO KNOW ABOUT BELT FASTENERS.

PRICE : 1/-

ASK YOUR DEALER -

APPEARANCE :

HE SELLS AND RECOMMENDS THEM.

FUNCTION & PERFORMANCE

Ensures more perfectly satisfactory belt service than any other fasteners. Connects belt ends with absolutely secure, immovable, unbreakable connection. Helps smooth easy belt running. Gives longest service, many having run 10,000 miles and still good. Enables instant belt adjustment in two minutes or less.

NAME :

STANDARD BELT FASTENERS

MANUFACTURER : HERWIN, CANNY & CO., 36, WILLIAM ST., WOOLWICH, S.E.

Why are manufacturers, one by one, adopting the PILOT JET? Type of carburetter

Because

Badcock's By-pass
The Pilot Jet,

Fitted to thousands of carburetters of all types during the last three years, has proved conclusively that a pilot jet is essential for—

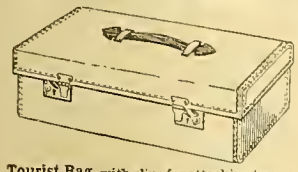
(1) A TICK round when idle.
(2) Even pulling at low speeds on top gear.
(3) Perfectly easy starting.
(4) Good acceleration.
(5) Economy in petrol, belts, tyres, and mechanism generally.
(6) Maximum results with minimum of air valve manipulation.

Send for interesting booklet on carburation; you will soon send for the By-pass, and add another to my splendid collection of testimonials.

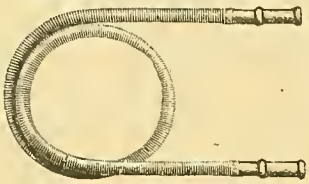
PRICE 10/6. NO SUCCESS, NO PAY.

SURREY WORKS, 110, WOODVILLE RD., THORNTON HEATH.

BROWN BROTHERS LIMITED



Tourist Bag, with clips for attaching to rear carrier. Well and strongly made, fitted with two English lever locks. Size 16 × 10 × 6in. No. B1/7. Brown waterproof canvas covered, each **12/6**

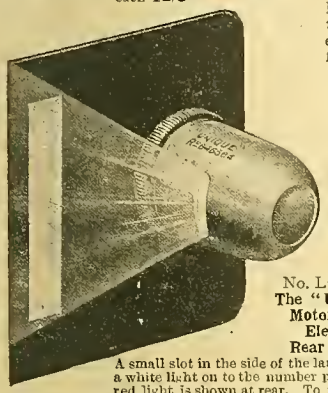


Flexible Armoured Non-rusting Gas Tubing.

Made of polished nickel wire, covering a thick rubber tube, with rubber push-on ends. The use of this Tubing is most satisfactory, as it will not kink or chafe through.

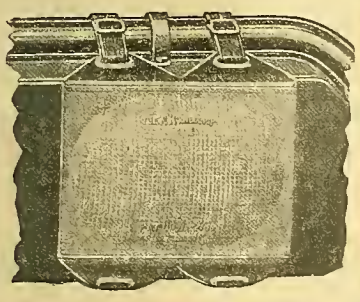
"B" Quality. With butted ends.

No. L70/32.	Length	12in.	each -/9
No. L70/33.	,,	18in.	,, 1/-
No. L70/34.	,,	24in.	,, 1/4



No. L32/245. **The "Unique" Motor Cycle Electric Rear Lamp.**

A small slot in the side of the lamp directs a white light on to the number plate, and a red light is shown at rear. To fix, drill a ¼in. round hole in the top right hand corner of the number plate and fasten with nuts provided. Price each **3/-** (less bulb). Bulbs extra **7d.**

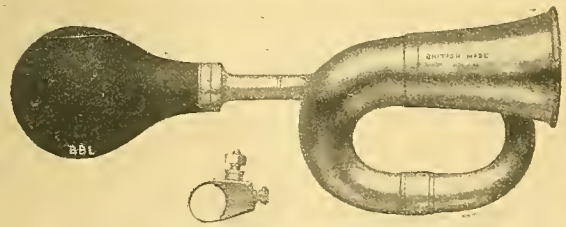


"A.K." KNEE GRIPS FOR MOTOR CYCLES.

(British Patent No. 21864/09.)

Made in the form of a broad belt or band of leather with convex rubber pads, secured round tanks with buckled straps. When fixed the grips are perfectly rigid. These grips give a firm seat in the saddle. Considerably less difficulty is experienced from the "wobble" created when riding at high speeds, making steering very much easier, as the knee-grip pads give the rider a firm hold on the machine, thereby leaving the hands free to manipulate handle-bar levers.

Standard, Laced, or Tourist Trophy Pattern, per pair **7/6**



"DUCO" MOTOR CYCLE SINGLE TURN HORN.

British Made. No. 8 bulb.

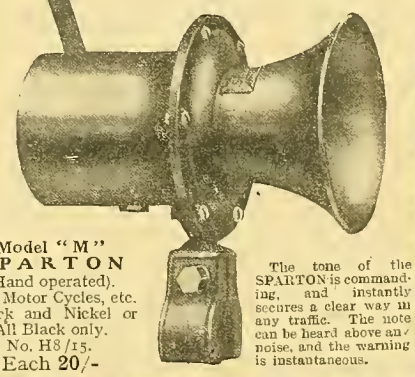
No. H5/24. Nickel finished .. each **11/6**

Black ,, .. ,, **12/6**

No. 7 Swivel Brackets extra, **-/6**, as illustration.

"SPARTON"

MECHANICAL WARNING SIGNAL for Motor Cycles.

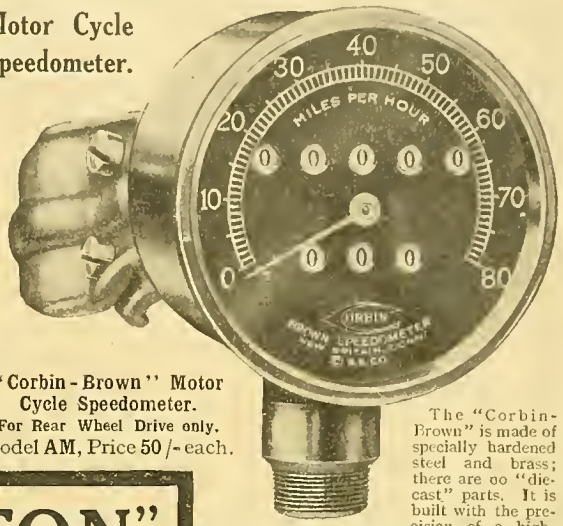


Model "M" **SPARTON**
(Hand operated).
For Motor Cycles, etc.
Black and Nickel or All Black only.
No. H8/15.
Each **20/-**

The tone of the SPARTON is commanding, and instantly secures a clear way in any traffic. The note can be heard above any noise, and the warning is instantaneous.

"CORBIN-BROWN"

Motor Cycle Speedometer.

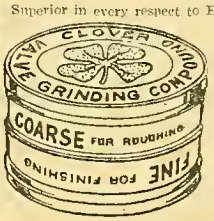


"Corbin-Brown" Motor Cycle Speedometer.
For Rear Wheel Drive only.
Model **AM**, Price **50/-** each.

The "Corbin-Brown" is made of specially hardened steel and brass; there are no "die-cast" parts. It is built with the precision of a high-grade watch. The cable is made of hardened steel, and is of the best possible construction. Every "Corbin-Brown" Speedometer is calibrated by hand and tested to absolute accuracy before being sent out. In the "Corbin-Brown" Speedometer, the parts are few and strong. Its centrifugal governor has four balance weights so sensitive that they respond to the slightest variation in speed. This centrifugal principle of the "Corbin-Brown" Speedometer is the same as that applied to the regulation of engines. It ensures absolute regularity of revolution.

CLOVER Valve Grinding Compound.

Superior in every respect to Emery and other Abrasives.



Cuts quickly and smoothly. Clean to use. Very economical. Clover compound is supplied in the form of paste in tins. Always moist and ready for immediate use. Sold in **1/-** duplex tins. Of all Garages and Motor Dealers.

Write for booklet—

"Hints on Valve Grinding," etc.

The "Duco" Combination Wheel Brush.

British Manufacture.

An entirely new pattern of wire wheel cleaning brush, registered design. Made of the finest quality bristle, tapered shape. The point of the brush is specially finished off with a tuft of very stiff bristle, to get into corners. The brush throughout is well made and finished. No. B28/17 Motor cycle size, each **2/6**

"FLASH" Antiseptic Hand Cleaner.

"Flash" cleans the hands and everything better and quicker than soap; it leaves the skin absolutely clean and free from injurious and unhealthy matter. "Flash" is thoroughly antiseptic, beneficial to the skin, and may be used with hard, soft, hot, cold, or salt water.

Price **3d.** and **6d.** per tin.

"Lodge" Sparking Plug.

Standard. Model C. Suitable for practically every make of motor cycle. Gives maximum efficiency. Absolutely and permanently gastight. Will not overheat or soot up. No. S26/14. Ea. **4/-**

22/-	**23/-**	**24/-**	**25/-**	**SPECIAL PRICE** for any length up to 8ft.

WHAT USERS SAY:

124, North End Road,
West Kensiogton, W.

Gentlemen,

Re the belt supplied to me early this year, I am more than delighted with it. I have done 2,126 miles so far with my Rudge Multi and sidecar. It has never given any trouble yet; it **will** not slip, and has a great advantage over any rubber belt, as it is **unbreakable** under all conditions. My belt is still good for another **3,000 miles at least.**

Yours truly,
H. RIDGWELL.

22, Parkfield Street, Rusholme.

To the Zilla Belt Co., Ltd., Manchester.

Dear Sirs,—Kindly forward at once one of your Zilla Belts. I have run same on my Rudge-Multi over 2,000 miles; it is still in PERFECT CONDITION. I find it very satisfactory, having no trouble with slipping, etc., and should certainly not think of using any other. A friend of mine whom I got to try one, says he would go miles out of his way to get a Zilla Belt.

Wishing you every success,
Yours respectfully, A. F. HOLDEN.

Perfect drive for **POWERFUL COMBINATIONS.**
Equal in wear to 4 or 5 Rubber Belts.
Requires NO Fastener.
Finest All-weather Belt.
Excellent Belt for Variable Pulley Gears.
Consider it the finest Belt on the Market.
Transmission without loss of power.

The "ZILLA" is the ONLY PERFECT Belt.
Get a "ZILLA" and end all your Belt troubles.

Don't delay, send to-day Postal Order or Cheque to:

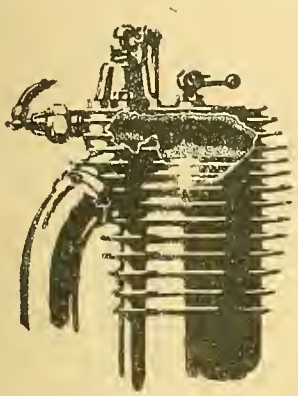
CARBON DEPOSIT

What causes it. How it can be avoided.



Of all the puzzling problems you face in motor-cycling, none is more confusing than—Carbon Deposit.

Barring mechanical troubles, faulty carburation and ignition, carbon deposit from lubricating oil may be summed up as follows:—

Carbon Deposit is caused by excess lubricating oil burning in the combustion chambers.

Prevent the presence of excess oil and you avoid undue carbon in your combustion chambers.

In some motors, the piston stroke will, by suction, draw a light oil too freely to the piston heads. In other motors a heavy oil will work to the piston heads.

In either case excess carbon will be deposited.

The remedy is obvious.

Keep excess oil from your combustion chambers by using an oil whose body and quality fit the mechanical conditions of your motor.

Every day it is being demonstrated that Gargoyle Mobiloils give remarkable freedom from carbon deposit.

Why? Not because Gargoyle Mobiloils are entirely free from carbon-giving properties. Such oils cannot be produced.

Simply because there is a grade of Gargoyle Mobiloil fully suited to the mechanical conditions of each type of motor.

The correct grade of Gargoyle Mobiloil will not reach the combustion chambers in excess quantities.

If the oil is not there to burn, it naturally cannot give carbon deposit.

It is sometimes said that the body of an oil indicates the amount of carbon it will deposit. Such advice is incorrect.

In many motors a light-bodied oil will deposit far more carbon than a heavy oil, due to the excessive quantity that works past the piston rings.

Oils have sometimes been put forward as "containing no carbon." All petroleum oils are chemical compounds, consisting almost entirely of hydrogen and carbon. To remove the carbon in chemical combination would destroy the oil. Free carbon and other impurities are easily removed.

Your safeguard against undue carbon deposit is to use the grade of Gargoyle Mobiloil especially suited to the mechanical conditions of your engine.

Gargoyle Mobiloils are sold by dealers everywhere.

GARGOYLE

Mobiloils

A grade for each type of motor.

WRITE TO-DAY

Send particulars of your machine, and we will tell you the correct grade of Gargoyle Mobiloil for efficient lubrication.

BRITISH ALL!

Someone has put forward the suggestion that "certain makes" of belt fasteners are "imported from abroad." We therefore take the opportunity of assuring our thousands of patrons that

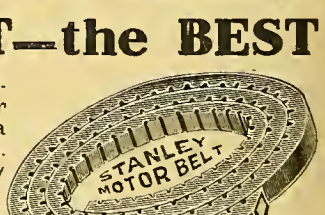
ALL STANLEY GOODS

ARE, and ALWAYS HAVE BEEN, MADE in GREAT BRITAIN by BRITISH WORKMEN.

THE STANLEY GOOD GOODS:	
STANLEY "SPARE LINK"	1/-
STANLEY FASTENER (Plated) ..	9d.
STANLEY "SHIELD"	8d.
STANLEY "ADJUSTING HOOKS" set of 3	6d.
"LION" FASTENER (Guaranteed 5,000 miles)	6d.

and—the

STANLEY BELT—the BEST



power transmitter for use on a motor cycle. Our many years' experience — on the road— enables us to offer riders a really reliable article. As the phrase goes, it is "AS GOOD AS THE STANLEY FASTENER."

⅝" 1/3, ¾" 1/6, ⅞" 1/9, 1" 1/11, 1⅛" 2/5 ft.

NOTE.—Owing to increase of cost of materials and labour we are reluctantly obliged to advance these prices by 10 per cent.

STANLEY MOTOR BELT & FASTENER CO.,
Inventors of the Original Hook Fastener
(Stanley Webb, Manager), **Bromley, Kent.**

"KING DICK"

Efficiency.

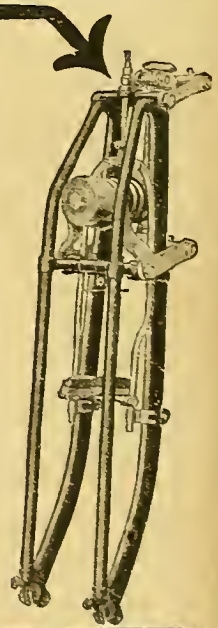
THE perfection of a machine depends on the perfection of its component parts. The splendid efficiency of Abingdon "King Dick" Motor Cycles and Engines is due to the high standard of mechanical perfection to which every part—down to the smallest detail—is built.

Ask your agent for details of new "King Dicks"—or write to us direct.

ABINGDON-ECCO, LTD.,
TYSELEY, BIRMINGHAM.
London Representative: G. H. Smith, 12, Mortimer Street, W.

TRADE MARK KING DICK

THE SAXON Compound SPRING FORKS take all the Shocks.



Sidecarists will find them indispensable.

Their steering qualities are perfect.

Get Saxons and avoid disappointment.

MADE IN 4 MODELS.

Send postcard to-day for full particulars.

S. R. RIDGWAY & CO.,
Patentees and Manufacturers,
Coventry Rd., BIRMINGHAM.

Cut Down Your Tyre Bill

Send your old covers—any make or style—to us and we will quote you by return the cost of a

Beldam Retread

We retread tyres so skilfully and with such good materials that the retreads often last longer than new covers. Thus you double the life of your tyre at little extra cost.

If you do not need our services now send for retreading list. It contains full particulars of cost of Retreads and Repairs.

Write also for Prices of Beldam Tyres.

OVERALLS MADE BY A PRACTICAL RIDER

Are the most satisfactory, because the man who rides knows what is wanted.

I have been experimenting for over ten years with materials and styles of cut, and I have tested them out on the road. This means satisfaction to you as it did to the writer of the following unsolicited testimonial:

Sept. 28th, 1914.

I am more than pleased with overalls. They are better in every way than I expected, and I am glad I struck your advert. I shall be glad to recommend your firm. It's a treat to get such satisfaction. You may use this as a testimonial. Yours truly—W. G. Adams. Estate Agent, Swindon, Wilts.

My Booklet will interest you—send for it to-day.—Irvine Smith.

Bad weather is the surest test of a ship's qualities.

The same may be applied to a newspaper, and the manner in which "The Motor Cycle" has withstood the storm and stress of the war has given ample proof of its sterling qualities.

¶ The decrease in the circulation due to the war has been much less than might have been expected, and for months past there has been a marked and steady growth in the weekly figures.

¶ The circulation is now very considerably in excess of

70,000

copies weekly.

N.B.—"The Motor Cycle" is the only paper of its kind that publishes certified circulation figures.

TRADE "ENOTS" MARK 'LAZY TONGS' Valve Spring Lifter.

Make YOUR Machine an All-weather Machine!

For an outlay of a few shillings you can make your machine a real all-weather machine.

The A1 Spring Roller Blind Mudshields

protect the legs and feet of the rider from mud, rain, and cold, biting winds, making bad weather riding as comfortable as it can ever be.

Only 15/- complete.

A1 MUDSCREEN CO.

39-41, Guildford St., LEEDS.

London Agents:

East London Rubber Co., Great Eastern Street; Brown Bros., Great Eastern Street, and Service Co., 292, High Holborn.

When ordering state maker's name, year, and h.p. of machine.

Why are manufacturers, one by one, adopting the PILOT JET? Type of carburetter

Because

Badcock's By-pass

The Pilot Jet,

Fitted to thousands of carburetters of all types during the last three years, has proved conclusively that a pilot jet is essential for—

(1) A TICK round when idle.
(2) Even pulling at low speeds on top gear.
(3) Perfectly easy starting.
(4) Good acceleration.
(5) Economy in petrol, belts, tyres, and mechanism generally.
(6) Maximum results with minimum of air valve manipulation.

Send for interesting booklet on carburation; you will soon send for the By-pass, and add another to my splendid collection of testimonials.

PRICE 10/6. NO SUCCESS, NO PAY.

SURREY WORKS, 110, WOODVILLE RD., THORNTON HEATH.

MISCELLANEOUS.

Velocette A REAL MOTORCYCLE IN MINIATURE

F.W.W.

—229 miles per gallon!

That's the official mileage obtained by Mr. T. Searell on a "Velocette" in the Tasmanian A.C. Petrol Consumption Test—a remarkable record in petrol economy. He also obtained 217 m.p.g. against a strong head wind, over the same course.

GRIMSBY HILL CLIMB 350 c.c. Class.—This was WON by Mr. C. H. Jennison on the little "VELOCETTE" of 220 c.c.

VELOCE Ltd., Fleet St., Birmingham.

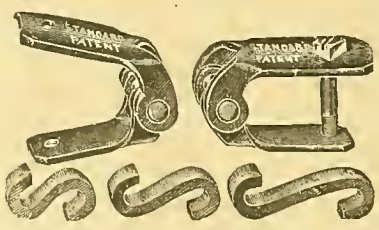
UNAPPROACHABLE!

LIKE our giant Dreadnoughts—these famous belt fasteners are playing their part in the great war—helping Britain and her Allies—proving absolutely unapproachable for reliability, efficiency, durability, time-saving, and in a hundred other ways.



Cut out *your* belt troubles by using **STANDARD or SIMPLEX Fasteners.**

CARBURETTERS

Simms Non-soot Plugs.

THESE prove reliable because they are tested so thoroughly. Before any plug can pass from our works it has to stand up against twice the working voltage and double the highest compression pressure. Only a perfectly sound plug can pass this test. That is why you should choose Simms "Non-soot" Plugs. They fire perfectly at all engine speeds.

Single or twin points.
Metric or American threads.

The Royal Ruby Two-stroke.

You must come at last

to the Royal Ruby. Thousands of motor cyclists have been induced to try other two-strokes; many of them have told us that they wished they had made the Royal Ruby their first choice. It would have saved them a lot of worry—and expense. We have studied the two-stroke motor bicycle as a speciality. We know just what is needed, how to make the most of its strong points and eliminate its weaknesses. The

ROYAL RUBY

Is not just a motor bicycle with a two-stroke engine. It is what it claims to be—a two-stroke motor bicycle. Do you see the difference? It is two-stroke-built all through. Here is the specification—run through it.

Specification.

FRAME.—Low built, soundly constructed, and with dropped back, giving low position. **FORKS.**—Druid lighweight (manufactured under Drew's patent). **ENGINE.**—Villiers' 2½ h.p., 2-stroke, 70 mm. × 70 mm. with c.c. 269. **CARBURETTER.**—Amac special. **BRAKES.**—Bowden front brake and belt rim brake. **BELT.**—Dunlop, ¾in. **SILENCER.**—Twin type of special design. **SADDLE.**—Middlemore and Lamplugh's pad seat, padded top. **CARRIER.**—Tubular. **TANK.**—Specially well made, holding 1¼ gallons of petrol and 1½ gills of oil, and fastened on two supports brazed to the frame. **MUDGUARDS.**—Deep section steel. **TYRES.**—Dunlop rubber-studded, 26io. × 2in., B.E.

Price, complete, £29 10s.
